## **Introduction:**

The purpose of this project was to give students taking Process Instrumentation and Control (INC) a visual demonstration of a PID control system. This system was to implement an automatic water level control loop that would be based on a user defined external set point. For example, if the water tank was empty, and the user wanted the water level to go to the top, the system would do this automatically based on the users set point.

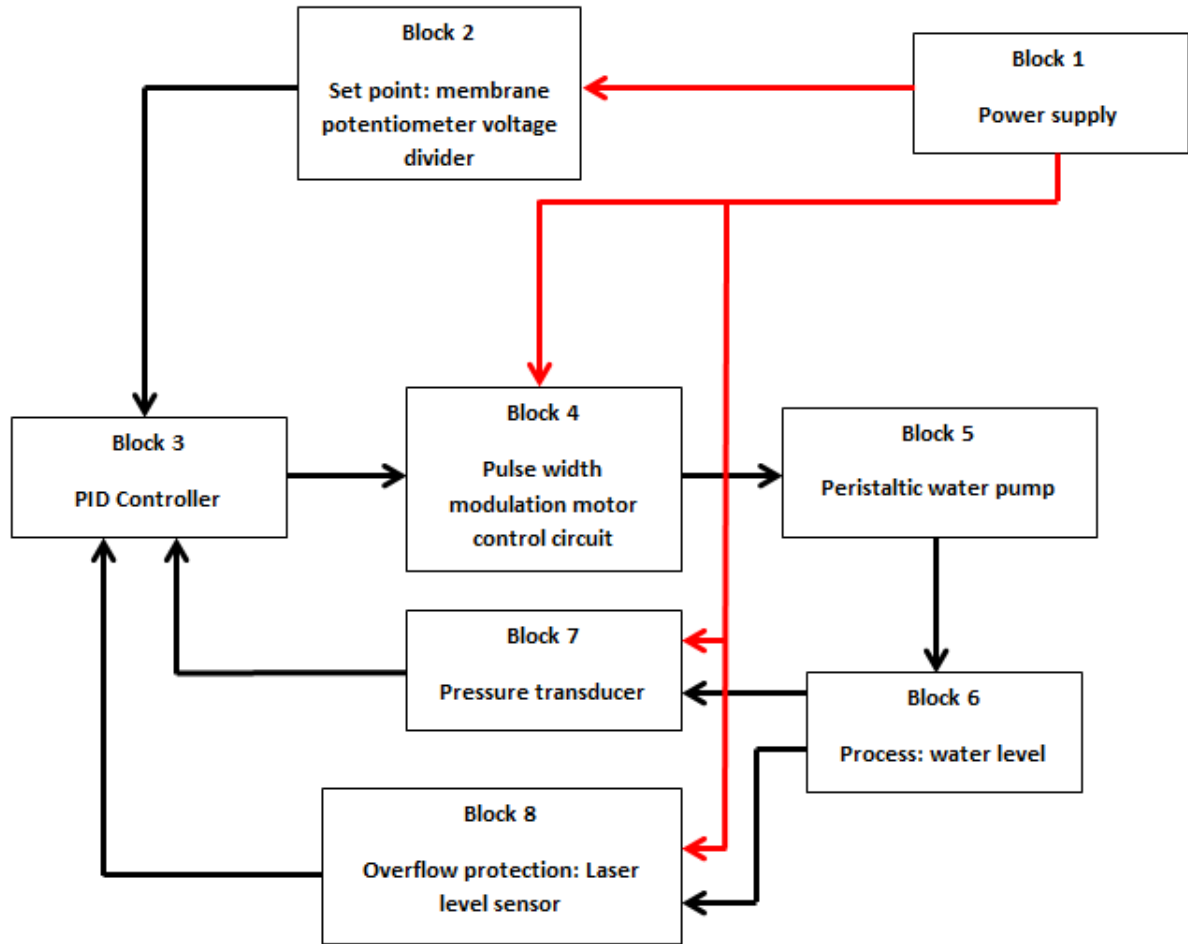

The system must be able to fill a 507 mL cylinder in under a minute. The water pump must be able to pump forwards, backwards, and maintain a water level. Setting the point to fill or drain to must be set by the user and must be part of the physical system. All components must be able to be carried by one person easily. The power supply to be used will need to be able to run all components in the system. All components that must be purchased will need to be within the budget of \$300.

## **Deliverables:**

- Must be a tank system with transducers for closed loop control of water level
- *VisSim 8.0* software will be used to implement the control algorithm
- *Solid Edge* software must be used to model the physical aspects of the system and to create the files necessary for 3D printing on a *Makerbot* 3D printer
- Final report must be in .docx format for *Microsoft Word*
- Final project must be completed by the beginning of Texpo

## **Design:**

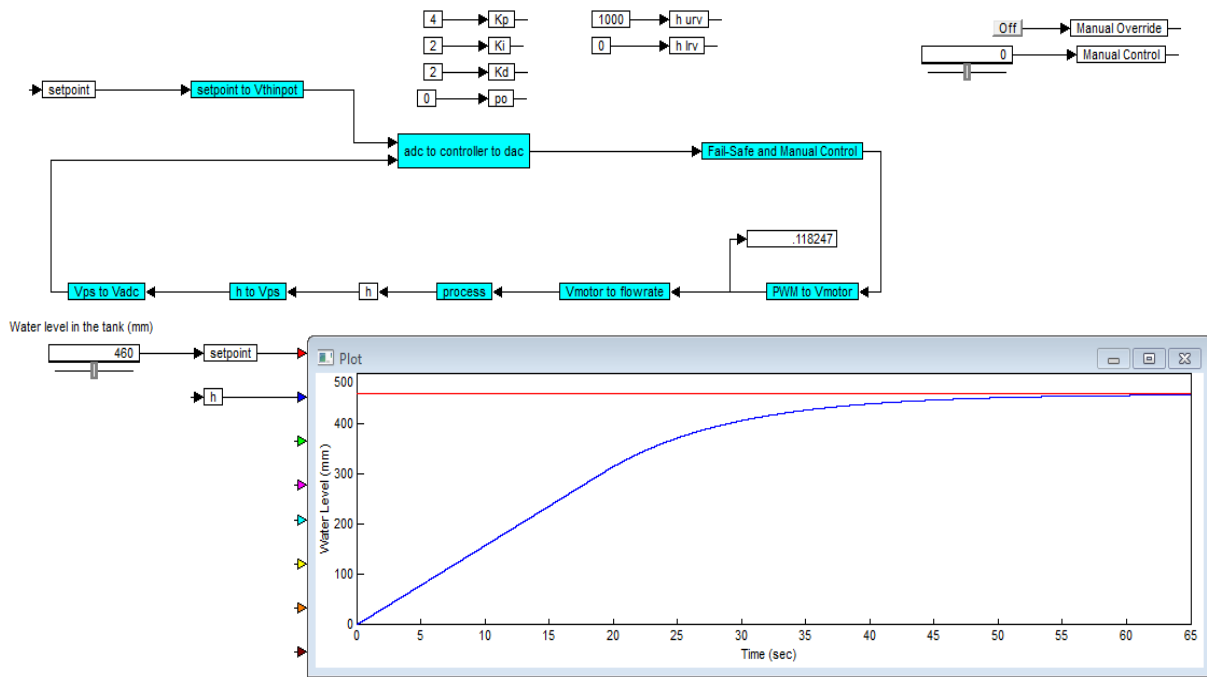

The block diagram, shown in Figure 1, is the overview of the control loop for the system. The power supply in Block 1 powers the membrane potentiometer voltage divider in Block 2, the motor control chip circuit in Block 4, the pressure transducer in Block 7, and the laser level sensor in Block 8. The data acquisition system (DAQ) in Block 3 takes inputs from the set point from Block 2, the pressure transducer from Block 7, and the laser sensor overflow protection in Block 8. These input signals are then interpreted by the *VisSim* simulation, which in turn runs the control algorithm and outputs a pulse width modulated (PWM) digital signal to the motor control chip circuit in Block 4. This signal is then transferred to the peristaltic water pump in Block 5, which then pumps water into the cylinder, or process, in Block 6. The pressure transducer in Block 7 senses the water level by transducing water pressure into a voltage signal which is then transferred to the DAQ and in turn to the controller. Block 8 implements the overflow protection via a laser range sensor, which will sense the level at which overflow is imminent and override the system by shutting it off.

**Figure 1: Block Diagram of Closed Loop Control System**

**Simulation:**

Before testing the actual system, a *VisSim 8.0* simulation was used to model the system. This is shown in Figure 2. All components were made into transfer functions implemented in each block of the control loop. The system response time would be under a minute, according to the simulation.

**Figure 2: VisSim Control System Simulation**

### Block 1: Power Supply

The power supply chosen is a 60W supply that outputs +5V at 3A, +15V at 0.5A, -15V at 0.5A, and +24V at 1.25A. There was more than enough power available from this supply for all the components. The max power rating of the membrane potentiometer is 1W. The L293E motor driver chips dissipates 5W max power. The *Honeywell* pressure transducer only requires 18.4 mW of power maximum. The maximum power consumed by the laser sensor is 1.85 W. This adds up to 7.87 W, which is much less than the maximum output of the supply.

This supply was already available from the Electrical Engineering department and did not need to be purchased. There were three commons, or zero volt reference ports, for the outputs. One each for the +5V, +24V, and +15V/-15V. These commons were bridged together in order to give a common 0V reference for all components powered by this supply.

### Block 2: Membrane Potentiometer Voltage Divider Set point

A membrane potentiometer, pictured in Figure 3, was chosen to implement the set point. The *Spectra Symbol SPL0751033%ST SoftPot* was chosen because of affordability, durability, and its 1 m length. This was purchased for \$24.39 from *Digikey*. The partial datasheet for the SoftPot is in Appendix A. The potentiometer was to be placed on a meter long plate of aluminum for structural integrity, as the membrane potentiometer is not stiff enough to stand on its own. The potentiometer had an adhesive tape on its back side, which was used to mount it on the aluminum plate. Membrane potentiometers change resistance based on where a pressure point is

being applied anywhere on its range. This means a linear change in resistance, and therefore voltage, from the low-end to the top-end of this resistor. The power supply of Block 1 supplies 0V and 5V for the outer pins (1 and 3), while the output voltage, varying between 0V and 5V, is obtained from pin 2. The voltage output of the potentiometer would then go to the Controller, Block 3, which in turn would interpret where the water lever would be raised or lowered to. This particular potentiometer is accurate within  $\pm 3\%$ , which means  $\pm 3$  cm over the range of 1 m. As the water level range itself is one meter also.

**Figure 3: Membrane Potentiometer**

In order to implement a pressure point that could be moved up or down and hold its position, a slider mechanism, Figure 4, was designed in *Solid Edge* and printed via the *Makerbot* 3D printer. This uses three skateboard wheel bearings to allow it to slide up and down. One bearing would roll on the membrane potentiometer on the front, and two on the back of the aluminum plate. The pressure can be varied on the slider mechanism by pressing it together or pulling it apart.

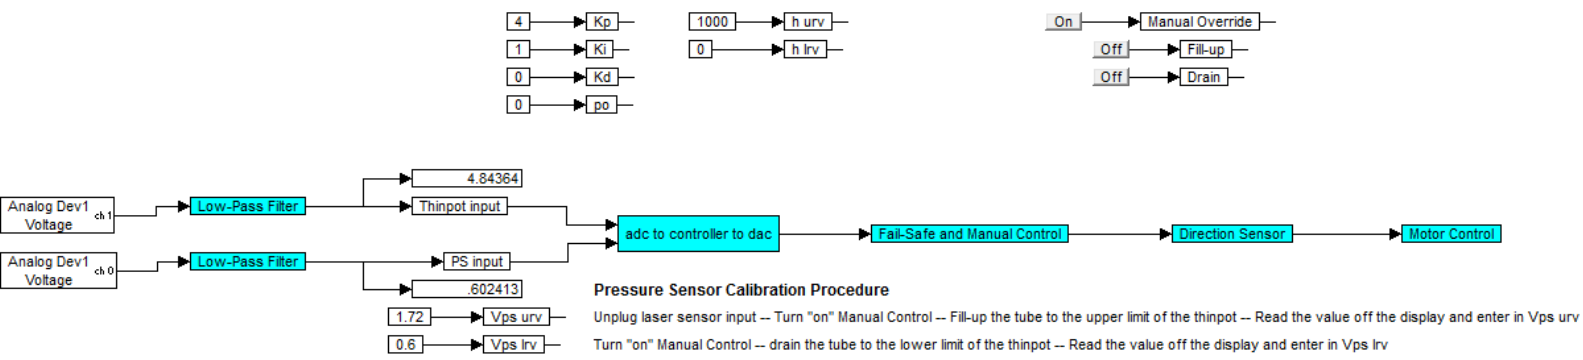

**Figure 4: Slider Mechanism**

### **Block 3: PID Controller and *VisSim* Program**

The PID controller for this project is programmed into *VisSim 8.0*. A *National Instruments NI USB6009* DAQ is used to feed the data from the system to the controller. The inputs of the membrane potentiometer set-point, the pressure transducer, and the laser sensor overflow protection are sent to the DAQ. After which the controller adjusts the water level by controlling the motor, through a PWM signal that is output through the DAQ. The DAQ used was selected due to its availability at the Electrical Engineering department. It is a 14 bit DAQ, with a percent resolution of 0.0061%. This is more than accurate enough for this application.

The program used to control the DAQ and implement the control algorithm is *VisSim 8.0*. *VisSim* is available on almost all Montana Tech computers and is very user friendly. It is also heavily used in INC. Figure 5 shows the control algorithm simulation in *VisSim*.

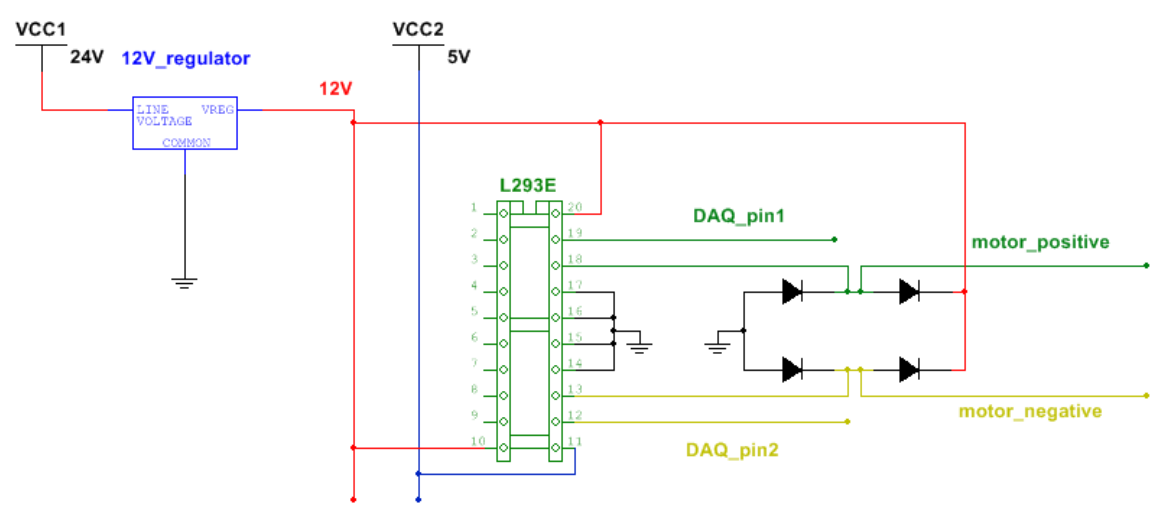

**Figure 5: VisSim PID Control Loop**

The controller block takes inputs from the membrane potentiometer voltage divider circuit in Block 2, the pressure transducer circuit in Block 7, and the laser sensor overflow protection circuit in Block 8. These three inputs are the basis of the control of the PWM circuit in Block 4.

**Block 4: Pulse Width Modulation Motor Control**

PWM was used to run the motor by varying the duty cycle of a 12V square wave. The chip used is the *ST Microelectronics* L293E push-pull four channel motor driver. This chip was also supplied by Montana Tech. The circuit diagram for the PWM motor control is pictured in Figure 6. The datasheet for the L293E is in Appendix A.

**Figure 6: Motor Control Circuit**

## Block 5: Peristaltic Water Pump

A peristaltic pump was chosen to drain and fill the water tank. Peristaltic pumps are unique in the fact that they can run in both directions and also hold the water level if stopped. A flexible silicon line runs inside of the pump, while rollers push fluid by pinching off the line. The PWM in Block 4 controls the rate at which the motor controlling the pump moves. The water pump in turn controls the water level, or process, in Block 6 by pulling water from a water reservoir located in the suitcase. The principle of how a peristaltic pump works is shown in Figure 7. The pump chosen is the *Boxer 15002* DC motor driven pump, purchased from *Clark Solutions* for \$171.23. This is also shown in Figure 7. This has a maximum flow rate of 529.2 ml/min which should have been able to fill the 507 mL water tube in about 57 seconds. This datasheet for the 15002 is in Appendix A.

Transfer function for peristaltic pump:  $FR = 16(\text{ml}/\text{min} \cdot V) V_{in}$  (flow rate = 16\*voltage in)

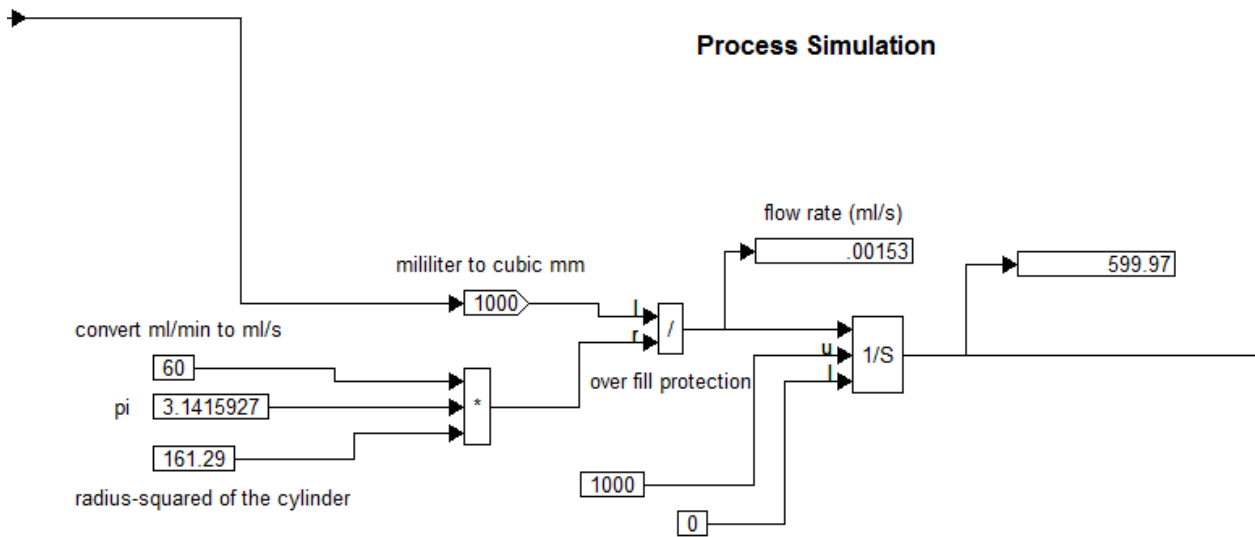

**Figure 7: Boxer 15002 Peristaltic Pump with Operation Example**

## Block 6: Process

The process of water level is contained in a one meter long one inch diameter clear PVC pipe, purchased from ACE Hardware. A base to hold the tube was designed in Solid Edge and printed on the *Makerbot* 3D printer. The slide potentiometer and aluminum plate it's attached to is also fitted into this base. At the top there is another 3D printed bracket that holds the top of the aluminum plate, the top of the tube, and the Laser Level Sensor. These components are shown in Figure 8. The process of water filling or draining to a certain level is then interpreted in water pressure by the pressure sensor in Block 7. If the water level goes too high, the entire system will be overridden by the laser level sensor in Block 8. The *VisSim* transfer function for the water level process is shown in Figure 9. A picture of the water level reaching the set-point is shown in Figure 10.

**Figure 8: Solid Edge 3D Renderings of the Base and Top Bracket**

**Figure 9: Process Transfer Function**

**Figure 10: Water Level Reaching Set-Point**

### **Block 7: Pressure Transducer**

The pressure transducer chosen is the Honeywell SSCDANV005PGAA5 (datasheet in Appendix A). This sensor was chosen because the output was an analog 0.5V to 4.5V over its range of 0-5 psig. This allowed for excellent resolution and a linear output signal. This transducer provides feedback about the process to the controller in Block 3. This was purchased from Mouser Electronics for \$45.66. The accuracy of this transducer is  $\pm 0.25\%$ . Figure 11 shows the pressure transducer.

Pressure sensor transfer function:  $V_{ps} = 0.005(\text{V/mm}) * H$  (pressure sensor voltage = 0.005 V/mm \* height in mm)

**Figure 11: Honeywell SSC Series Pressure Transducer**

## Block 8: Laser Level Sensor Overflow Protection

The SICK DS50 laser level sensor is the instrument used for the overflow protection system. It outputs either logic 0, zero volts, or logic 1, five volts, at a user specified distances. Once the water level reaches that distance, threatening overflow, a function in the controller will override the rest of the system and shut off the water pump. The input circuit for the laser sensor to the DAQ, as well as the sensor itself, is pictured in Figure 12. This circuit takes the 12V output of the sensor and gains it to 5V. This pump was donated for the project by Montana Precision Products.

Transfer function of laser sensor:  $\text{process} = \text{process} * Q1'$

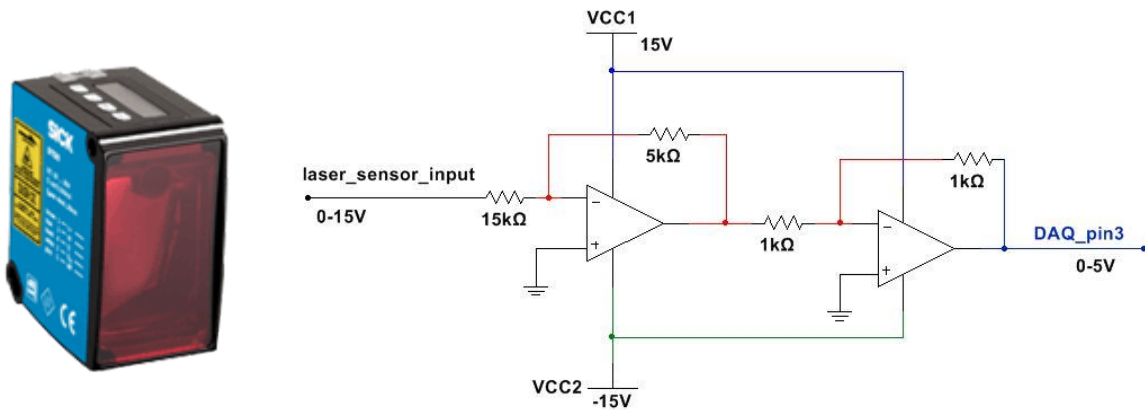

Figure 12: Laser Sensor and Input Circuit

### Bill of Materials:

The following, Figure 13, is a list of materials bought for this project. Many components were already available within the Electrical Engineering department. Other components were purchased either online or at the local hardware store.

Mechanical Portion				
Component	Description	Quantity	Price/component	Total
Peristaltic pump	Flow rate: 700 ml/min inlet/outlet OD: 4.8mm	1	\$171.23	\$171.23
Tubing	ID: 4.8mm	1 m	\$5.00	\$5.00
Tubing barbs	OD: 4.8mm	2	\$0.75	\$1.50
Clear PVC Tube	ID:1" length: 36"	3 ft	\$3.65	\$10.95
Reservoir bladder	Capacity: 1 L	1	\$6.92	\$6.92
Level Sensor	SICK 200 laser level sensor	supplied	\$0.00	\$0.00
Mounting material	clear plastic sheet	supplied	\$0.00	\$0.00
Fasteners	Screws, bolts, nuts, etc...	supplied	\$0.00	\$0.00

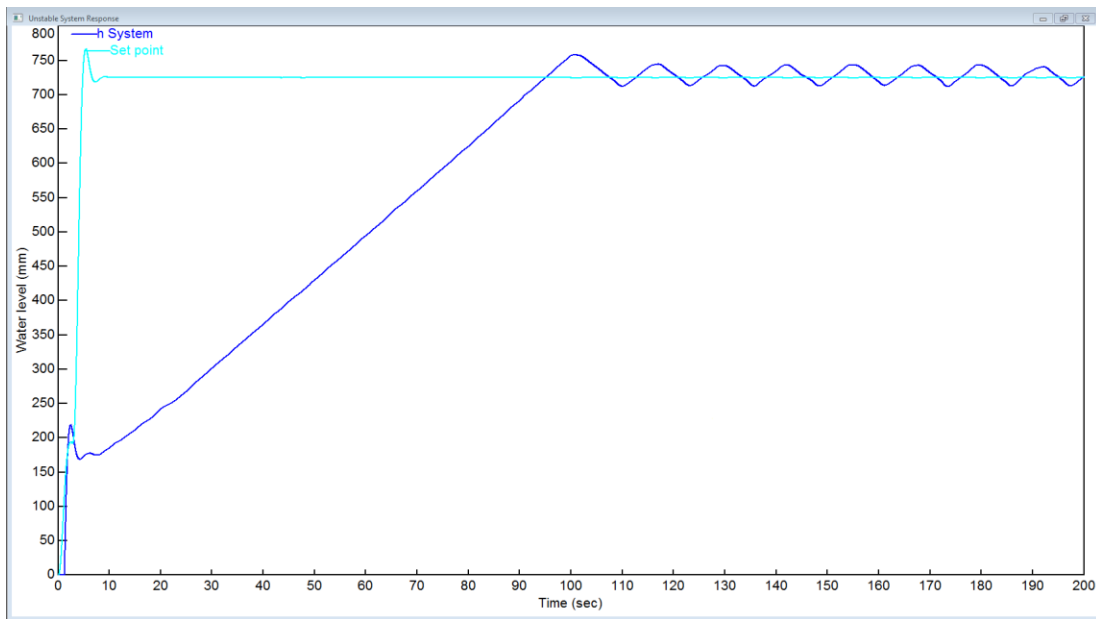

Electrical Portion				
Component	Description	Quantity	Price/component	Total
Power Supply		supplied	\$0.00	\$0.00
DAQ	Acquisition system	supplied	\$0.00	\$0.00
Resistors		supplied	\$0.00	\$0.00
PWM Motor Driver Chip	PWM	supplied	\$0.00	\$0.00
Pressure Transducer	Honeywell	1	\$45.66	\$45.66
Membrane Potentiometer	Spectra Symbol	1	\$24.39	\$24.39
			Grand Total	\$265.65

**Figure 11: Bill of Materials**

## **Data and Results:**

The design requirement of filling up from empty in under a minute could not be accomplished. In reality, it takes almost three minutes. Realistically the peristaltic pumps flow rate is much slower than expected, about 179 mL/min as compared to the claimed 529 mL/min. This is partially due to the 12V voltage regulator only putting out 11.2V. Max flow rate is attained at 12V. Also, it is possible the max flow rate when the company tested it is 529 mL/min. Perhaps the average flow rate would be different. This max rate may not account for a load on the pump and may be during an ideal scenario too. The slow flow rate was an unfortunate set back, and this late in the game there is nothing left to do. Also, the maximum flow rate is probably calculated with ideal conditions, i.e. no load on the motor. The silicon tubing and the weight of the water may have put a load on the motor and slowed it down.

Controller tuning has taken many iterations through trial and error. A root locus design would have been very helpful, but it was determined that manual tuning would be a faster process. Figure 12 shows the un-tuned response. Notice the overshoot and oscillation. This is with complete PID control. The proportional gain  $K_P$  was set to 12, integral gain  $K_I$  set to 8, and derivative gain  $K_D$  set to 2.

**Figure 12: Un-Tuned System Response**

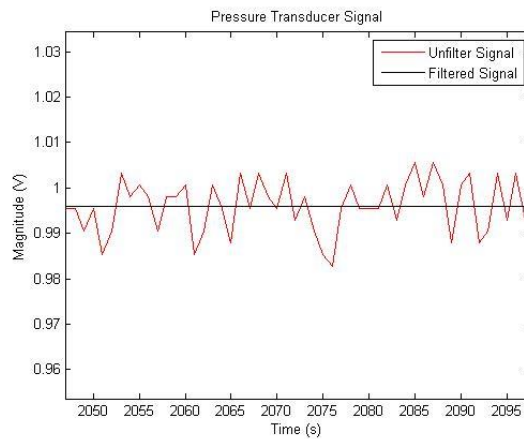

This tune was not going to work. Tuning started with setting  $K_I$  and  $K_D$  to zero, and setting  $K_P$  to 1.  $K_P$  was increased until the system showed a better response. The system did not oscillate, but steady-state error was quite evident.  $K_I$  was set to 0.5 and this eliminated steady state error, but the response was not fast enough.  $K_I$  was then increased by increments of 0.1 until a fast enough response was achieved.  $K_D$  was left at zero because adding  $K_D$  did not affect the response. The tuned response is shown in Figure 13.  $K_D$  was set to 4 and  $K_I$  was set to 1.

**Figure 13: Tuned Controller Response**

One problem with the pressure transducer is the fact that you have to calibrate it before each use. These instructions are in Appendix A. Also, the pressure transducer's signal ended up having a lot of noise. This is due to the vibrations transmitted by the peristaltic pump creating pressure spikes each time a roller pushes an amount of water into the tube. A built-in filter function in *VisSim* was used to create a third-order Butterworth low pass filter to smooth out the signal from the transducer. The filtered signal did have windup, but smoothed out nicely. The filtered signal versus unfiltered signal is shown in a *Matlab* plot in Figure 13. The transfer function for the filter is shown in Figure 14.

**Figure 13: Matlab Plot of Filtered vs. Unfiltered Pressure Transducer Signal**

**Figure 14: Third Order Butterworth Low-Pass Filter**

### **Summary:**

This project will make an excellent visual demonstration of a PID control system for INC students. This implements automatic water level control fairly well, and demonstrates a control loop. The system did not fill in under a minute. If a faster water pump could be purchased this would most likely fix this problem. Perhaps a root locus design would aid in a faster response as well. The pressure transducer is far too sensitive to environmental factors and the calibration process is time consuming. If time and budget weren't a factor, perhaps a less sensitive pressure sensor could be purchased. It would also be nice to implement water level feedback via an analog laser range sensor. This would be able to implement overflow protection and feedback, therefore eliminating the pressure sensor entirely.

## **Appendix A**

### **Setup Procedure**

#### **Setting Voltage Range of the Pressure Transducer:**

Use the manual control setting in *VisSim* to move the water level to the upper and lower bounds to determine the voltage output readings of the pressure transducer at these points. Enter the voltage at the upper range point into “Vps urv” and enter the lower range voltage into “Vps lrv”. These directions are reiterated in The *VisSim* PID control program.

## SOFTPOT

### Features

- Linear Position Sensor
- IP65 Dust Proof, Water Proof (Intense Spray)
- Polyester Substrate
- 3M Pressure Sensitive Adhesive (PSA)
- Upon Request
  - Male or Female Nicomatic or Berg Connectors
  - Wiper of 1-3 Newton Force to Actuate Part
  - Higher Temperature and/or Contactless Options Available

### Mechanical Specifications

- Life Cycle: >1 million
- Height:  $\leq 0.51\text{mm}$  (0.020")
- Actuation Force (with a 10mm wide active cavity):
  - 40°C 0.8 to 1.8 N
  - 25°C 0.8 to 1.8 N
  - +23°C 0.6 to 1.5 N
  - +50°C 0.6 to 1.5 N

### Environmental Specifications

- Operating Temperature: -40°C to +50°C
- Humidity: No affect @ 95% RH, 4hrs 50°C
- IP Rating of Active Area: IP65

### Electrical Specifications

- Resistance - Standard: 10k Ohms (lengths >300mm = 20k Ohms)
- Resistance - Custom: 1k to 100k Ohms
- Resistance Tolerance:  $\pm 20\%$
- Effective Electrical Travel: 8 to 2000mm
- Linearity (Independent): Linear  $\pm 1\%$  & 3% Rotary  $\pm 3\%$  & 5%
- Repeatability: No hysteresis, but with any wiper looseness some hysteresis will occur
- Power Rating (depending on size, varies with length and temperature): 1 Watt max. @ 25°C,  $\leq 0.5$  Watt recommended
- Resolution: Analog output theoretically infinite; affected by variation of contact wiper surface area.
- Dielectric Value: No affect @ 500VAC for 1 minute

**L293B**  
**L293E**

**PUSH-PULL FOUR CHANNEL DRIVERS**

- OUTPUT CURRENT 1A PER CHANNEL
- PEAK OUTPUT CURRENT 2A PER CHANNEL (non repetitive)
- INHIBIT FACILITY
- HIGH NOISE IMMUNITY
- SEPARATE LOGIC SUPPLY
- OVERTEMPERATURE PROTECTION

**DESCRIPTION**

The L293B and L293E are quad push-pull drivers capable of delivering output currents to 1A per channel. Each channel is controlled by a TTL-compatible logic input and each pair of drivers (a full bridge) is equipped with an inhibit input which turns off all four transistors. A separate supply input is provided for the logic so that it may be run off a lower voltage to reduce dissipation.

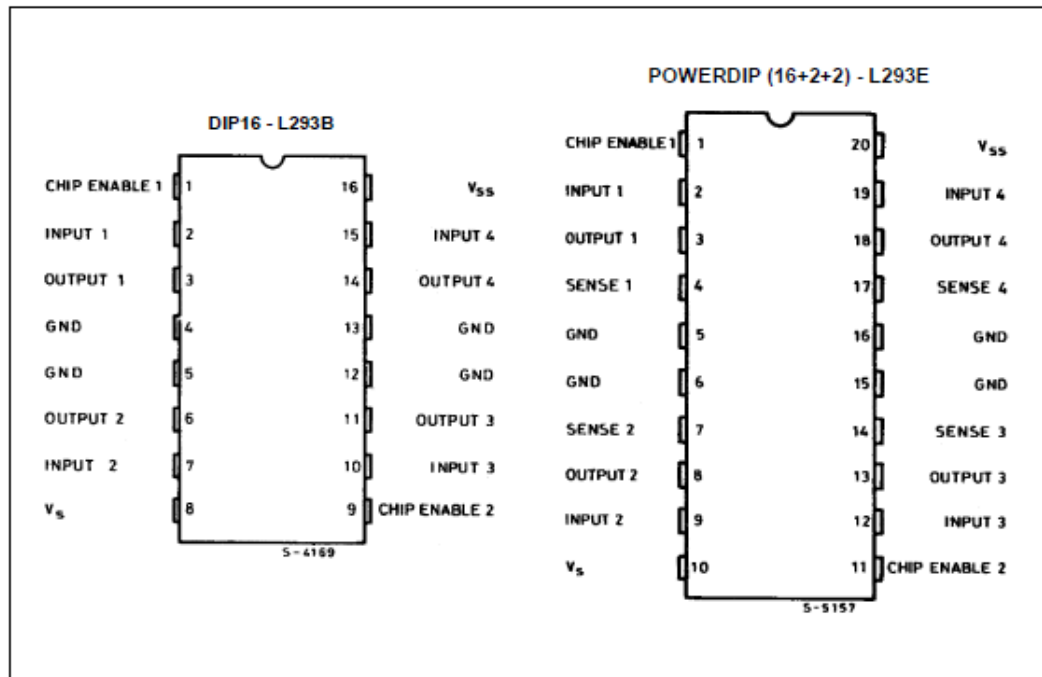

Additionally, the L293E has external connection of

sensing resistors, for switchmode control.

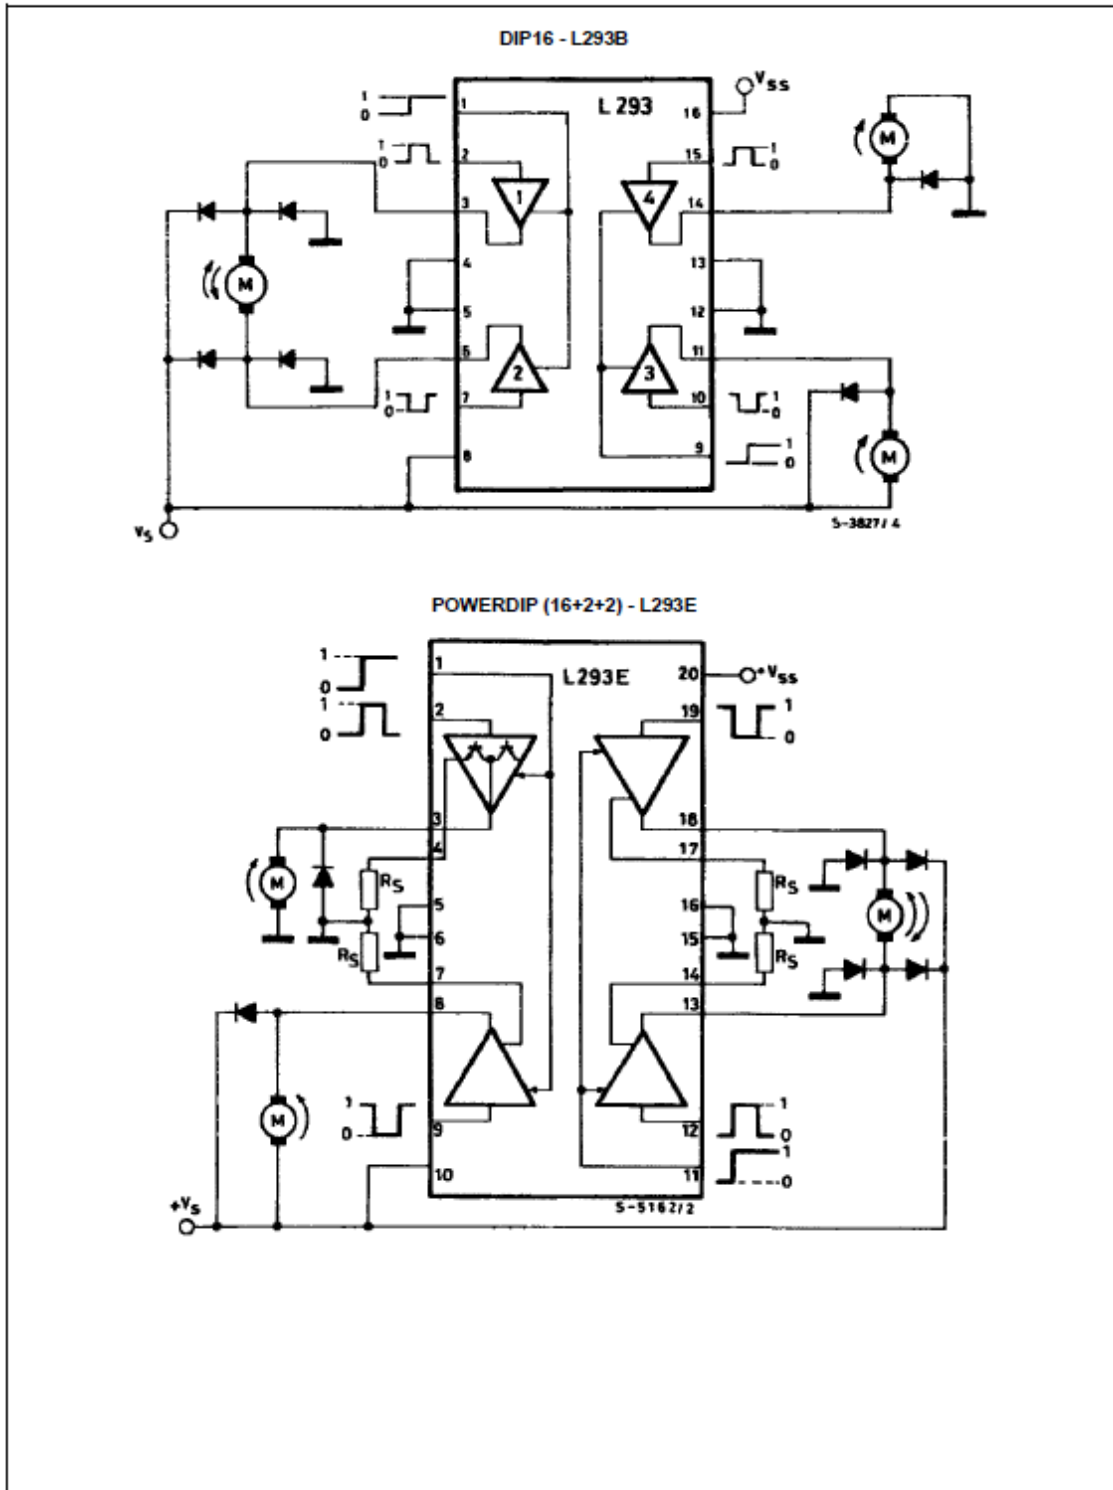

The L293B and L293E are package in 16 and 20-pin plastic DIPs respectively ; both use the four center pins to conduct heat to the printed circuit board.

<sup>1</sup>The transfer function limits define the output of the sensor at a given pressure input. By specifying P<sub>min</sub> and P<sub>max</sub>, the output at P<sub>min</sub> and P<sub>max</sub>, the complete transfer function of the sensor is defined. See the graphical representations of the transfer function in Figure 2. For other available transfer functions contact Honeywell Customer Service.

<sup>2</sup>SPI output function is not available in SIP package.

<sup>3</sup>Custom pressure ranges are available. Contact Honeywell Customer Service for more information.

<sup>4</sup>See the explanation of sensor pressure types in Table 4.

<sup>5</sup>See the CAUTION in this document.

<sup>6</sup>Options T and V are only available on pressure ranges ±60 mbar to ±10 bar | ±6 kPa to ±1 MPa | ±1 psi to ±150 psi.

Sensor Intelligence.

### Mid range distance sensors Dx50, DS50

Model Name > [DS50-P1112](#)  
Part No. > [1047402](#)

#### At a glance

- HDDM™ technology provides the best reliability, safety to ambient light and price/performance ratio
- Reliable detection up to 10 m
- High switching repeatability (2.5 mm)
- Two discrete outputs with up to 50 Hz switching frequency
- Three switching modes: "Distance to Object," "Window" or "Object Between Sensor and Background" - detect any object
- Immune to cross talk for use with multiple sensors
- Superior background suppression

#### Your benefits

- Precise detection at a safe distance reduces scrap and increases throughput
- Immune to any type of ambient light - allows for use in optically challenging environments
- Widest temperature range allows for outdoor use without additional cooling or heating
- Intuitive setup via display or remote teach reduces installation time and costs
- Red light and an optional alignment bracket reduces installation time
- Metal housing withstands harsh environments, saving replacement costs
- Dx50 product family is based on a common platform, which offers multiple performance levels, making it easy to accommodate future changes
- Low investment costs and high performance guarantee short return on investment

CE III CDRH

#### Performance

Measurement range:	200 mm ... 10,000 mm, 90 % remission 200 mm ... 4,000 mm, 6 % remission 200 mm ... 6,000 mm, 18 % remission
Resolution <sup>1)</sup> :	1 mm
Repeatability <sup>2)</sup> , <sup>3)</sup> , <sup>4)</sup> :	5 mm/2.5 mm
Accuracy <sup>5)</sup> , <sup>6)</sup> :	± 10 mm
Response time <sup>7)</sup> :	10 ms/50 ms
Switching frequency <sup>8)</sup> :	50 Hz/10 Hz
Light source:	Laser, red
Typ. light spot size (distance):	15 mm x 15 mm (10 m)

Additional function:	Switch-off display Unique measurement value Set switching mode: Distance to object (DtO)/Window (Wnd)/Object between sensor and background (ObSB) Teach-in of switching output Set moving average: fast/slow Set hysteresis Crosstalk safety Teach-in of switching outputs Lock user interface Reset to factory default Multifunctional input: laser off/external teach/inactive Switching output invertible
Laser class:	2 (EN 60825-1) <sup>9)</sup>
Laser service life (MTTF at 25 °C):	100,000 h

<sup>1) 5)</sup> Related to distance value on the display <sup>2)</sup> Equivalent to  $1\sigma$  <sup>3)</sup> 6 % ... 90 % remission <sup>4) 7) 8)</sup> Dependent on the set average: fast/slow <sup>6)</sup> 90 % remission <sup>9)</sup>

Wavelength: 658 nm; max. output: 180 mW; pulse duration: 5 ns; pulse repetition rate: 1/200

### Interfaces

Output type::	2 x PNP (100 mA) <sup>1) 2)</sup>
Hysteresis:	1 mm ... 9,999 mm
Multifunctional input (MF) <sup>3), 4)</sup> :	1 x

<sup>1)</sup> Output Q short-circuit protected <sup>2)</sup> PNP: HIGH =  $V_S - (< 2.5 V)$ /LOW = 0 V <sup>3)</sup> Response time  $\leq 60$  ms <sup>4)</sup> PNP: HIGH =  $V_S$  / LOW =  $\leq 2.5$  V

### Mechanics/electronics

Supply voltage $V_S$ <sup>1)</sup> :	DC 10 V ... 30 V
Ripple <sup>2)</sup> :	$\leq 5$ Vpp
Power consumption <sup>3)</sup> :	$\leq 1.85$ W
Initialization time:	$\leq 350$ ms
Warm-up time:	$\leq 15$ min
Housing material:	Die-cast zinc housing (ZNAL4CU1) acrylic glass (PMMA)
Connection type:	Male connector, M12, 5-pin
Indication:	2 x LED, LC display
Weight:	200 g

<sup>1)</sup> Limit values, reverse-polarity protected, operation in short-circuit protected network: max. 8 A <sup>2)</sup> May not fall short of or exceed  $V_S$  tolerances <sup>3)</sup> Without load

### Ambient data

Enclosure rating:	IP 65
Protection class:	III
Ambient temperature:	Operation: -30 ... +65 °C, Storage: -40 ... +75 °C
Max. rel. humidity (not condensing):	$\leq 95$ %
Vibration resistance:	EN 60068-2-6/EN 60068-2-64
Shock resistance:	EN 60068-2-27
Typ. ambient light safety:	40 klx
