RE: Butte Priority Soils Operable Unit (BPSOU) Draft Final Quarterly Operations and Maintenance Report Butte Treatment Lagoon System – Second Quarter 2021.

Agency Representatives:

I am writing you on behalf of Atlantic Richfield Company to submit the **Draft Final** Quarterly Operations and Maintenance Report Butte Treatment Lagoon System – **Second Quarter 2021.**

The report, appendices, and supplemental files may be downloaded at the following link:

Link: https://pioneertechnicalservices.sharepoint.com/:f:/s/submitted/EjtrCG-WL99IkSRubUG0934BUXkSXISFIYdAYTKf15XNQg

If you have any questions or comments, please call me at (406) 723-1820.

Sincerely,

Dave Griffis, Liability Manager

1.0 INTRODUCTION

This quarterly operations and maintenance (O&M) report summarizes water quality monitoring results and flow data collection at the Butte Treatment Lagoons (BTL) during the second quarter of 2021, the period from April 1 to June 30 (referred to as quarter). Sample station locations monitored during this period are shown on Figure 1 and identified below by location name, station field identification, and sample identification:

| Sample Station Name | Station Field Identification | Sample Identification |
|-------------------------|------------------------------|--------------------------|
| Effluent sample station | EFS-07 | SS-1 |
| Influent sample station | INF-04 | SS-2 |
| MSD-HCC station | MSD-HCC | SS-3 |

Various sample results and reports referenced in this text are included in Appendices A-C.

All work described in this document was performed as detailed in the BTL Groundwater Treatment System Routine Operation, Maintenance, and Monitoring (OM&M) Plan (Atlantic Richfield, 2021) (referred to as the *Routine OM&M Plan*). Refer to the Routine OM&M Plan for additional details related to sampling and monitoring tasks. Samples collected were sent to Pace Analytical Laboratory for analysis. The laboratory completed data verification and validation (Level II) according to the laboratory quality assurance procedures. All data included in this quarterly report are provided as final. Final analytical data results are in Appendix A and the corresponding Data Summary Report (DSR) is in Appendix D.

Final validated data for the quarter are provided in the Data Validation Report (DVR), which is an appendix to the DSR (Appendix D). Data validation was conducted by an independent data validator—not involved with sampling activities and who does not work for the analytical laboratory—for all analytical data represented in this report.

2.0 SYSTEM DESCRIPTION SUMMARY

Impacted water from the West Camp Pump Station (WCP-1), Missoula Gulch baseflow, Butte Priority Soil Operable Unit (BPSOU) subdrain (subdrain), Butte Reduction Works (BRW) groundwater capture, Hydraulic Control Channel (HCC) groundwater capture, and BTL system D-cells is conveyed to the BTL collection cell, Cell D4, and then pumped from Cell D4 to the Chemical Addition System (CAS) building as influent flow, where pre-treatment water quality is monitored at SS-2. The influent flow is mixed with lime slurry to reach a target potential hydrogen (pH), which allows dissolved heavy metals to precipitate and separate from the collected groundwater as treated water flows through a series of lagoon cells in the remainder of the BTL system. The lime slurry is created by adding dry calcium hydroxide, delivered by an accurate measurement system measured by milligrams of lime (calcium hydroxide) per liter (mg/L) of influent water, to a portion of the influent water. The slurry is then added back to the remainder of the influent, and pH-adjusted influent flow is directed to three parallel lagoon cell systems. Each system consists of three, unlined, open water cells operating in parallel: A, B, and

C, where the A system is to the north and C to the south. The primary purpose of the first cell is to allow the chemical reaction to occur, introduce additional carbon dioxide to the system, and to capture sediment and chemical precipitates. A fourth series of smaller, non-treatment cells, the D cells, is to the south of lagoons A2 and A3. The D cells act as hydraulic barriers between the treatment cells and Silver Bow Creek. Treated effluent water is then discharged to Silver Bow Creek at the effluent station, SS-1.

3.0 MONITORING

Water quality samples are typically collected using automated ISCO samplers programmed to collect composite samples over a 24-hour period. Sample station and monitoring locations are shown on Figure 1. These composite samples are collected automatically twice each week at EFS-07 (SS-1) and once each week at INF-04 (SS-2). Field grab samples are collected at station MSD-HCC (SS-3) monthly. Samples are analyzed for total recoverable metals (aluminum, arsenic, cadmium, copper, iron, mercury, lead, silver, zinc, calcium, magnesium, uranium) and hardness.

In addition to total recoverable metals analysis, samples are also analyzed for alkalinity, total dissolved solids, total suspended solids, and nitrates/nitrites once per month. Quality control samples, field blank (SS-4) and field duplicate (T), are collected monthly. Field parameters are collected daily at many points within the system and real-time data are collected by an automated monitoring system.

Treated effluent meeting the water quality standards described in Table 1 of the Routine OM&M Plan (taken from the Montana Department of Environmental Quality [DEQ] Circular DEQ-7 Montana Numeric Water Quality Standards [DEQ, 2006]) is discharged to Silver Bow Creek at EFS-07. All reported total recoverable aluminum values are below the dissolved standard. If the total recoverable value exceeds the dissolved standard for aluminum, additional analysis will be performed on the dissolved sample to determine the dissolved fraction present in the sample. The dissolved aluminum results will then be reported and compared to the dissolved standard.

The DEQ-7 aquatic life standards for cadmium, copper, lead, silver, and zinc are dependent on effluent hardness with an upper limit of 400 mg/L calcium carbonate (CaCO₃). Hardness of BTL effluent is most commonly greater than 400 mg/L calcium carbonate resulting in a consistent maximum standard from sample to sample.

4.0 SYSTEM PERFORMANCE SUMMARY

No exceedances of DEQ-7 standards were observed for aluminum, iron, lead, mercury, silver, or zinc during this reporting period. Water quality graphics for the major contaminants of concern (COCs) (arsenic, cadmium, copper, zinc, silver, iron, mercury, and lead) are provided in Appendix A.2.

Two effluent samples (LAO-SS-1-041221 and LAO-SS-1-041521), both with a laboratory result of 0.011 mg/L exceeded the human health standard for arsenic of 0.010 mg/L. Samples LAO-SS-1-050621, LAO-SS-1-051021, and LAO-SS-2-051021 were analyzed for mercury by

method 245.1 (method detection limit [MDL] of 0.000045 mg/L) due to a reagent issue at the laboratory. These samples were re-analyzed for mercury by method 245.1 LL (MDL 0.0000047 mg/L) out of hold. Both analyses were reported as non-detects below the human health standard of 0.00005 mg/L. Exceedance information and COC statistics are shown in the Discharge Monitoring Report (DMR) Form in Appendix A.1. The maximum target for effluent pH, 9.50 standard units (SU), was not exceeded during this reporting period.

Complete BTL information for this reporting period is included with this report in separate electronic files, including an O&M events log and Field Data Summary file. The electronic file also includes graphical representations of the data. Analytical laboratory reports are also included with this report as separate electronic files for reference (as appropriate).

5.0 OPERATIONS SUMMARY

The BTL has been running under routine operations as described in the OM&M Plan. Further details of treatment operations and site events for this reporting period are described in the following sections.

5.1 Influent Conditions

Influent flow measured at SS-2 is summarized below. Appendix B contains a graphical representation of the influent flow data.

Influent Flow

Total Flow 139.7 million gallons Average Flow Rate 1,066 gallons per minute

5.2 BPSOU Subdrain Pump Station Conditions

Flow pumped from the Pump Station and Wet Vault water levels are summarized below. Appendix B contains a graphical representation of the flow data.

Pump System Flow

Total Flow 58 million gallons Average Flow Rate 442 gallons per minute

Wet Vault Levels

Minimum 5,435.83 feet above mean sea level-National Geodetic

Vertical Datum 29 (amsl-NGVD29)

Maximum 5,436.92 feet amsl-NGVD29 Average 5,435.87 feet amsl-NGVD29

5.3 West Camp Pump Station Conditions

The WCP-1 flow and water levels are summarized below. Appendix B contains graphical representation of the recorded data.

West Camp Pump System Flow

| Total Flow | 20.8 million gallons |
|-------------------|------------------------|
| Average Flow Rate | 159 gallons per minute |

West Camp Water Levels

| Minimum | 5,421.33 | feet amsl-NGVD29 |
|---------|----------|------------------|
| Maximum | 5,421.74 | feet amsl-NGVD29 |
| Average | 5,421.42 | feet amsl-NGVD29 |

5.4 Missoula Gulch Baseflow and Hydraulic Control Channel Flow

Missoula Gulch baseflow and groundwater collected by the HCC surrounding Lower Area One (LAO) make up the remaining influent flow. The base flow (discharging groundwater) from the upper portion of the Missoula Gulch drainage typically ranges from 50 to 100 gallons per minute and eventually discharges to the HCC. The HCC flow is comprised of influent sources previously described, recaptured flow from the lagoon system, and captured untreated groundwater along the boundary of LAO. No flow measurement devices are in place to quantify the flow of groundwater from these sources.

5.5 Lime Addition

Daily lime usage, calculated on total lime dispensed via the gravimetric system, and dosage set point are listed below. Lime addition ceased for brief periods to accommodate general maintenance, and these periods were recorded in system notes.

Lime Set Point

| Minimum | 115 | mg/L |
|-------------|-----|------|
| Maximum | 130 | mg/L |
| Most Common | 120 | mg/L |

Daily Lime Dosage (calculated)

| Minimum | 115 | mg/L |
|------------------|-----|------|
| Maximum | 131 | mg/L |
| Average | 125 | mg/L |
| Total Lime Usage | 73 | Tons |

Post-treatment pH (minimum, maximum, and average) measured at station INDC, is listed below. Appendix B includes daily lime addition and influent flow data and resulting pH values through the treatment process.

Post-treatment pH at INDC

| Minimum | 9.91 | SU |
|---------|-------|----|
| Maximum | 10.42 | SU |
| Average | 10.16 | SU |

5.6 Effluent Conditions

Effluent flow measured near SS-1 and the quarterly *effluent deficit* to influent flow are listed below. Appendix B provides graphical and tabulated data of influent and effluent flows.

Effluent Flow

| Total Flow | 113.2 million gallons |
|-------------------|------------------------|
| Average Flow Rate | 864 gallons per minute |

Influent – Effluent Deficit

| System Loss/Recirculation | 26.5 million gallons |
|-------------------------------|------------------------|
| Average system loss flow rate | 202 gallons per minute |

5.7 Effluent pH

Effluent pH (minimum, maximum, and average) measured at station SS-1 is listed below. The maximum target for pH, 9.50 SU, was not exceeded during this reporting period.

| pН | (a) | SS-I | 1 |
|----|-----|------|---|
| | | | |

| Minimum | 9.08 SU |
|---------------------------------------|---------|
| Maximum | 9.45 SU |
| Average | 9.27 SU |
| Exceedances above pH greater than 9.5 | 0 |

5.8 Inspection and Maintenance

Site operators completed routine maintenance and quarterly overview inspection tasks as listed in the Routine OM&M Plan. Appendix C contains a summary of the operator O&M events log. During the second quarter, the following tasks were completed:

- Monthly downloading and semi-annual maintenance of the subdrain area-velocity (AV) flow meters located in the subdrain.
- Annual maintenance of the site back-up generators was completed in June. Spring dredging was completed in the A1, B1, and C1 cells from April 5 to May 6, 2021.
- The dredging of lagoon cell A1 was initiated on April 7, 2021. Dredging was completed in lagoon cell C1 on May 5, 2021.

- Dredging of the D4 pond was completed from May 10 to June 4, 2021.
- The spring jetting of the subdrain was completed on June 15 and 16, 2021. Pigging of both the north and south discharge lines from the BPSOU vault to the discharge at the HCC was completed on June 17, 2021.

6.0 TRAINING

Site operators continued to review standard operating procedures relevant to work assignments, and also received training on seasonal tasks. Appendix C contains a training log for the quarter.

7.0 CONCLUSION

No exceedances of DEQ-7 water quality standards for aluminum, , iron, lead, mercury, silver, or zinc were observed in the BTL effluent samples, and the maximum effluent pH, 9.5 SU, was not exceeded. The BTL system performed effectively through the reporting period and operators continued to optimize treatment. Appendix A.2 contains a summary of analytical results at the effluent discharge point SS-1.

Two arsenic effluent samples exceeded the human health standard during the second quarter: arsenic values of 0.011 mg/L on 04/12/21 and 04/15/21, standard value of 0.010 mg/L. There were no upset conditions noted prior to these samples being collected.

Appendix A.2 Analytical Laboratory Results

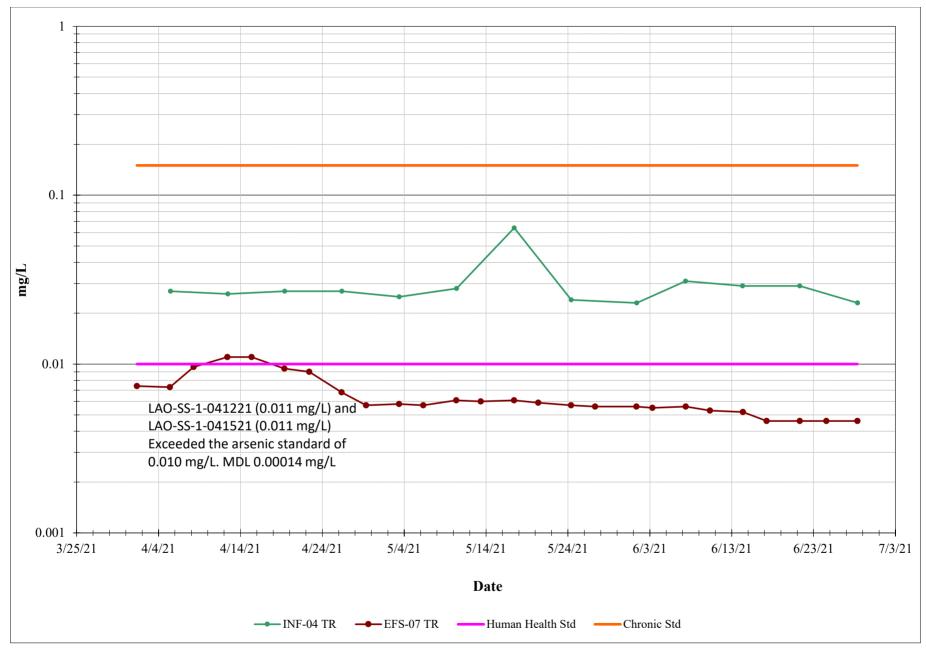

(Analytical results are provided electronically in the BTLChemicalDump Excel file included with this report)

Butte Treatment Lagoon System Silver Concentration- Final

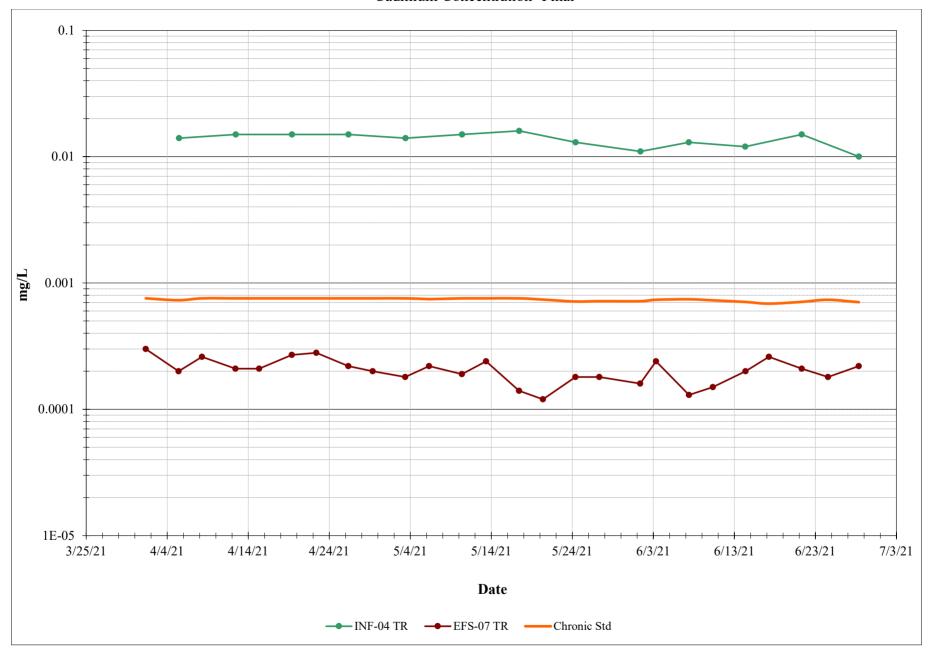

Silver maximum standard is DEQ-7 Acute Aquatic standard calculated based on effluent (EFS-07) hardness.

Butte Treatment Lagoon System Arsenic Concentration- Final

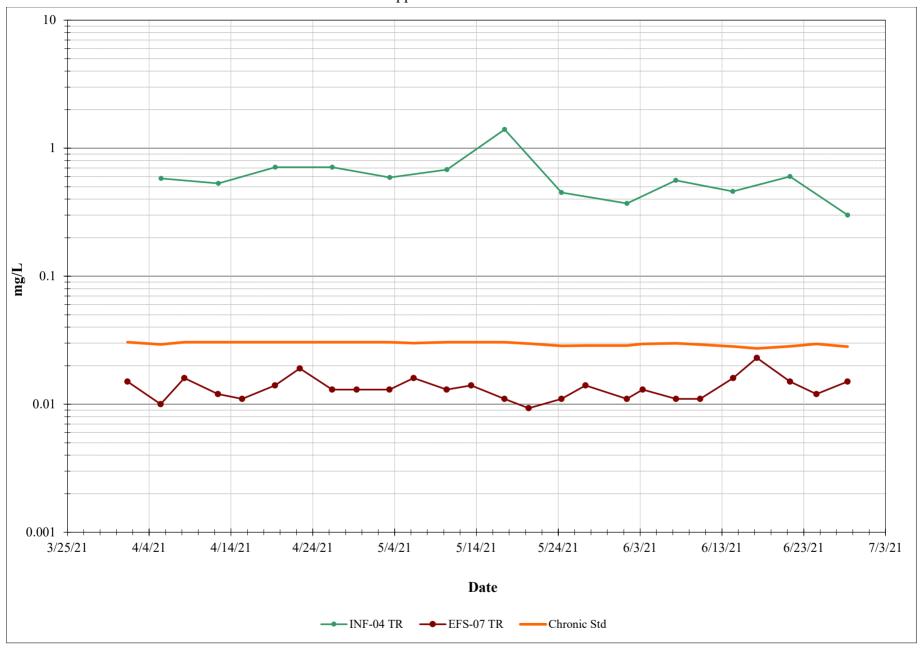

Arsenic maximum standard is DEQ-7 Human Heath standard.

Butte Treatment Lagoon System Cadmium Concentration- Final

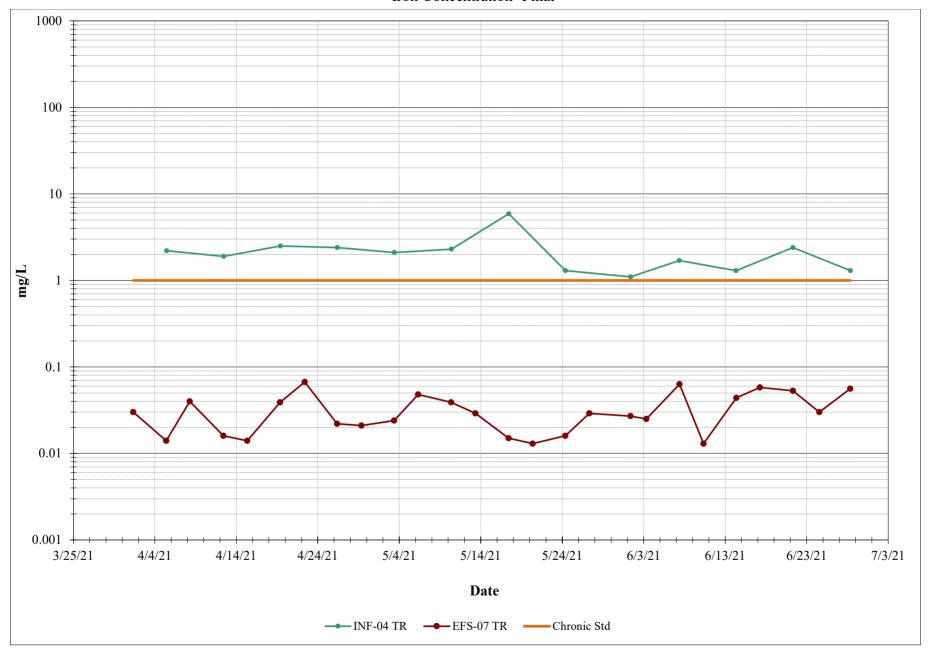

Cadmium maximum standard is DEQ-7 Chronic Aquatic standard calculated based on effluent (EFS-07) hardness.

Butte Treatment Lagoon System Copper Concentration- Final

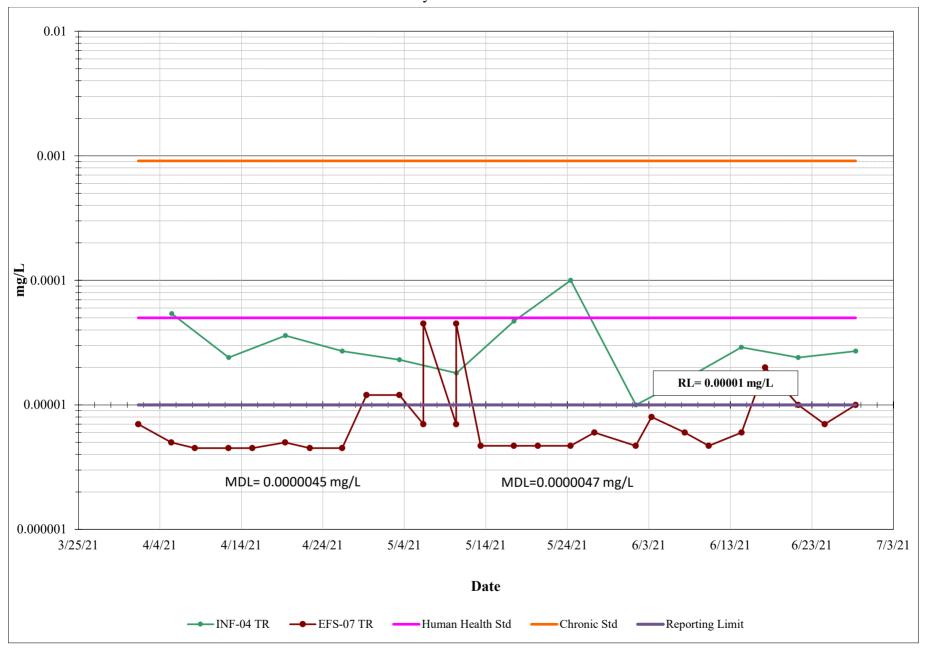

Copper maximum standard is DEQ-7 Chronic Aquatic standard calculated based on effluent (EFS-07) hardness.

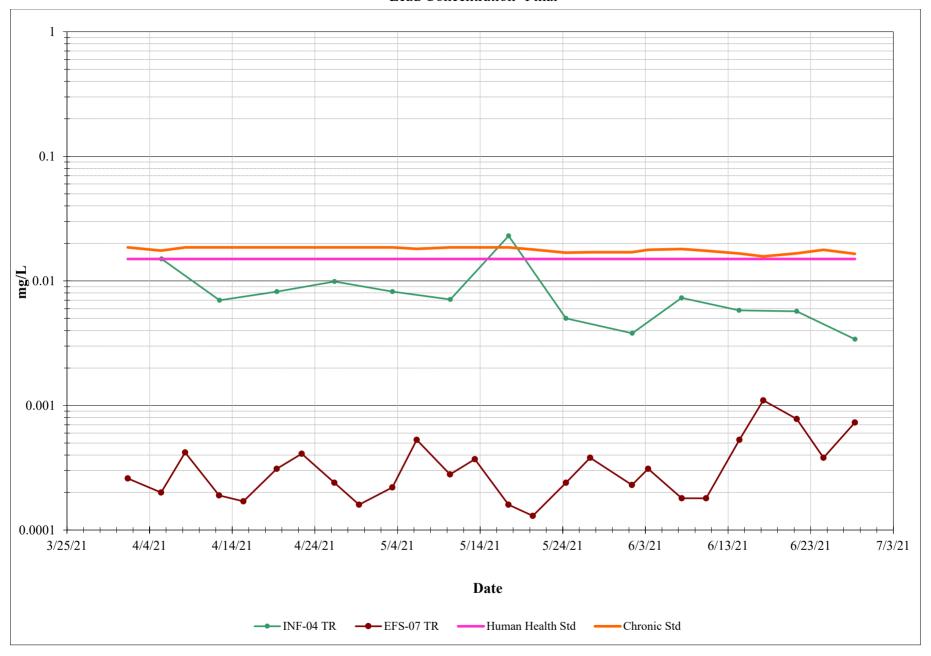

Butte Treatment Lagoon System Iron Concentration- Final

Butte Treatment Lagoon System Mercury Concentration- Final

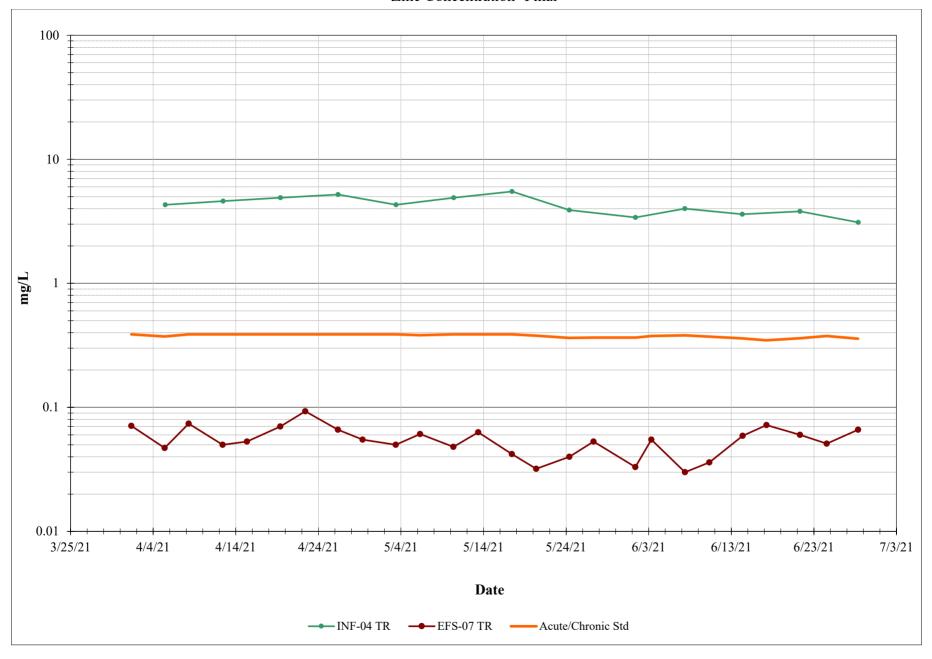

Butte Treatment Lagoon System Lead Concentration- Final

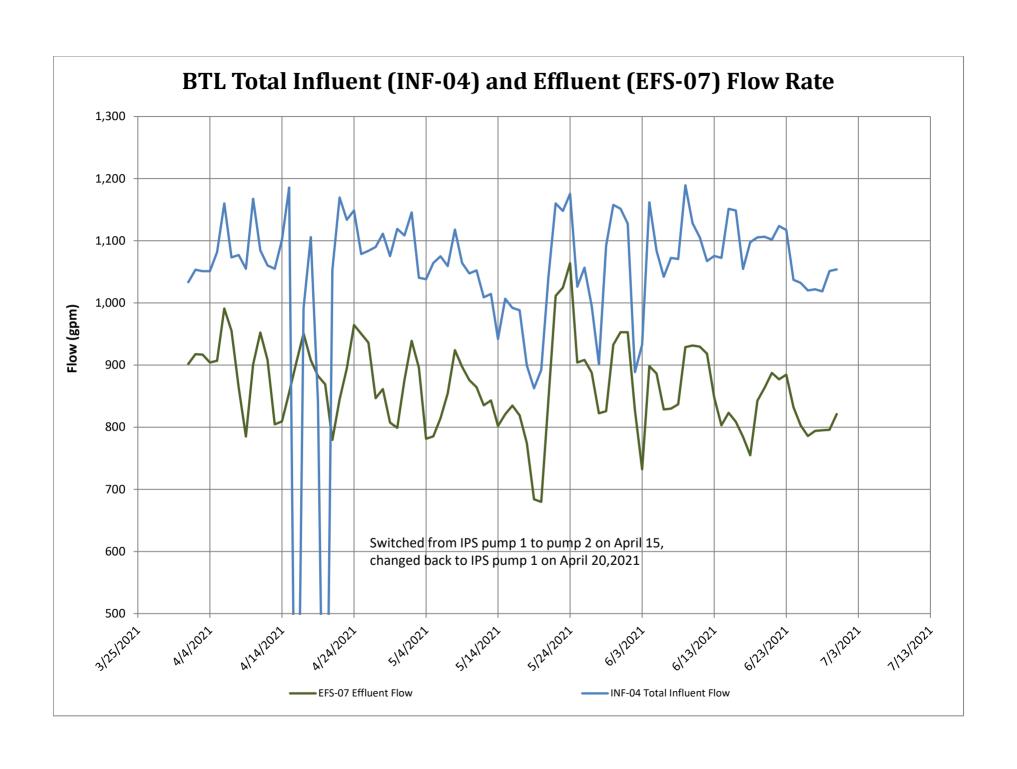

Lead maximum standard is DEQ-7 Human Health standard. Chronic Aquatic Life standard calculated based on effluent (EFS-07) hardness.

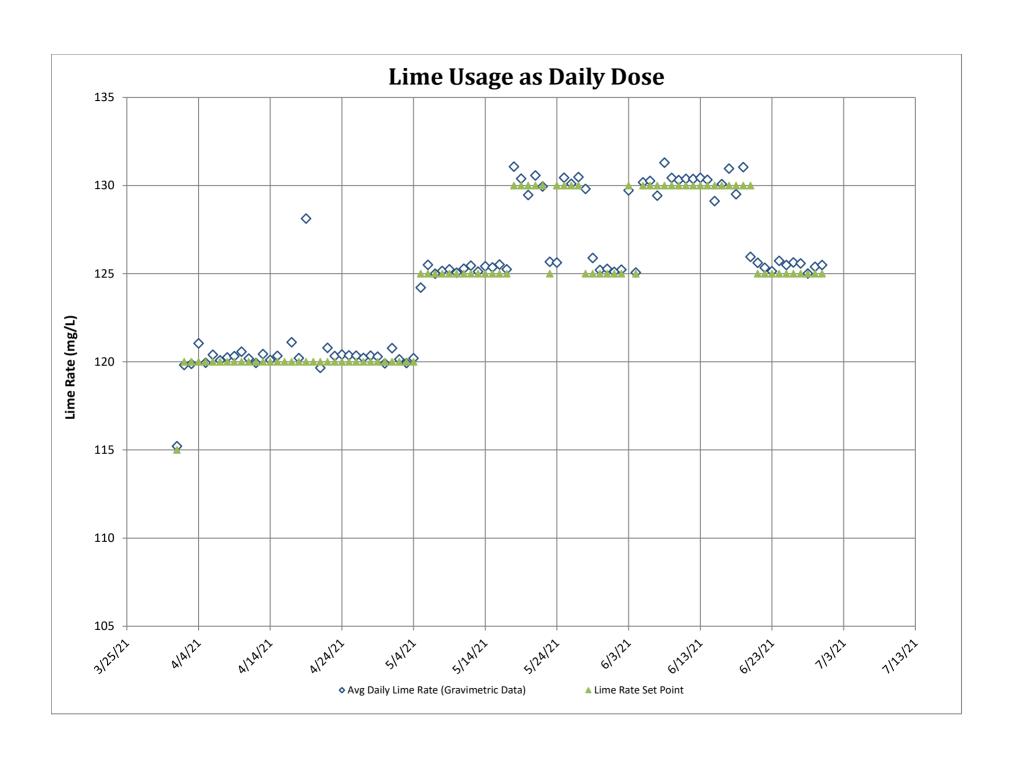

Butte Treatment Lagoon System Zinc Concentration- Final

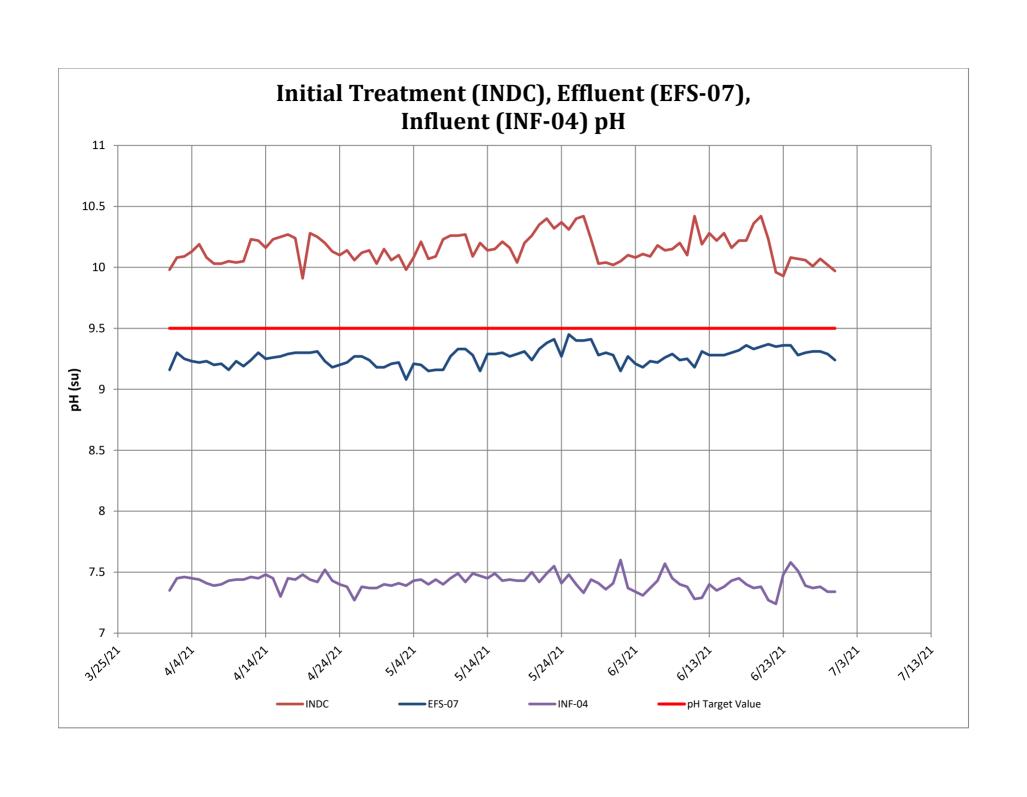

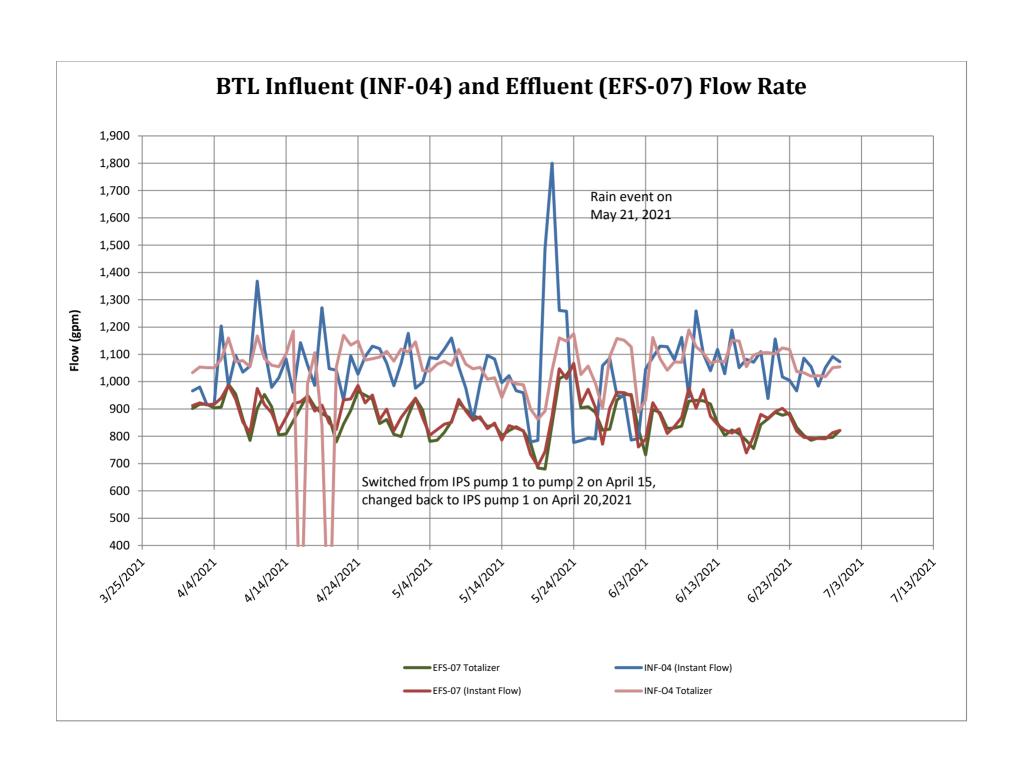

Zinc maximum standard is DEQ-7 Acute/Chronic standard calculated based on effluent (EFS-07) hardness.

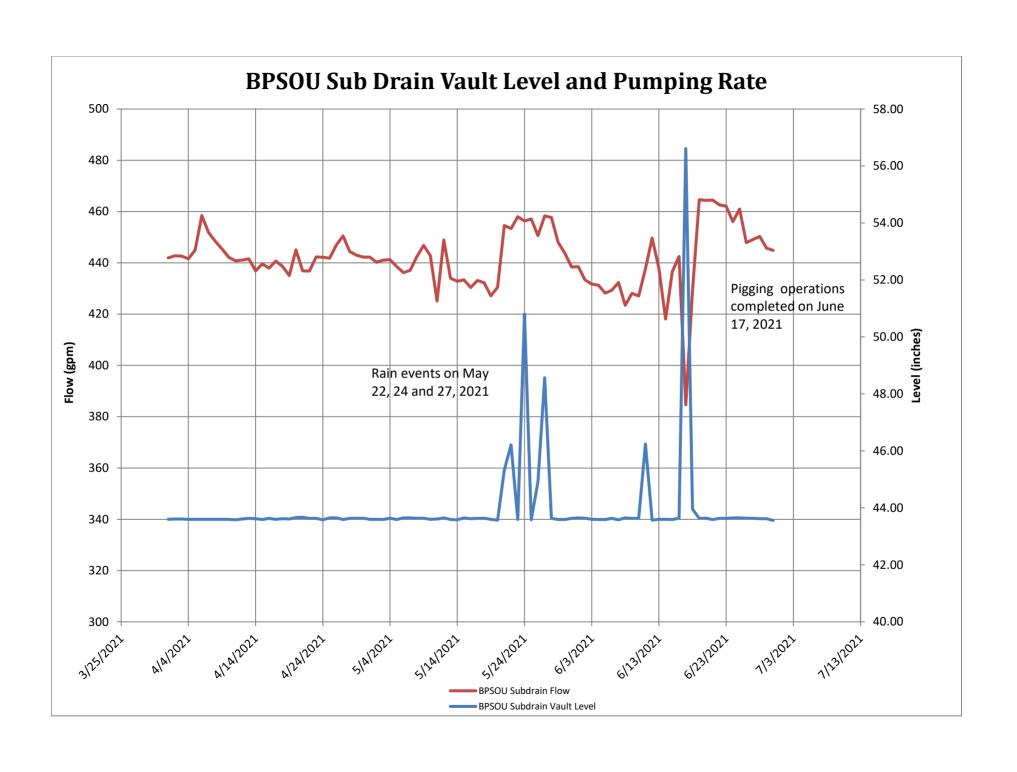

Appendix B System Flows, Levels, and pH

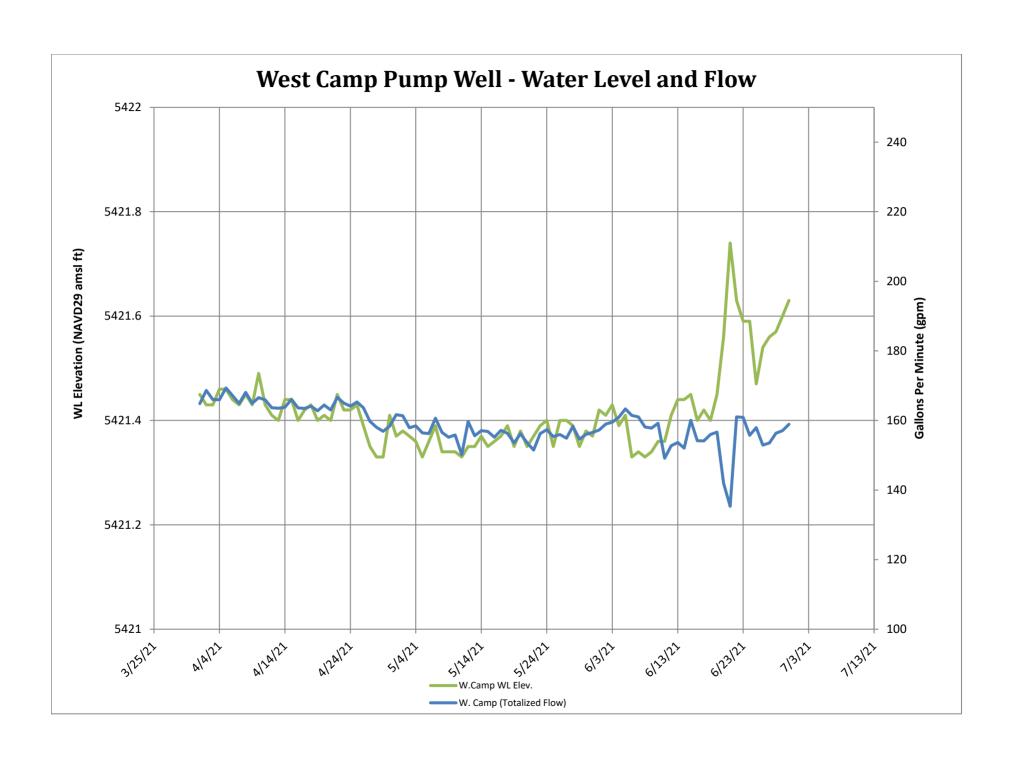

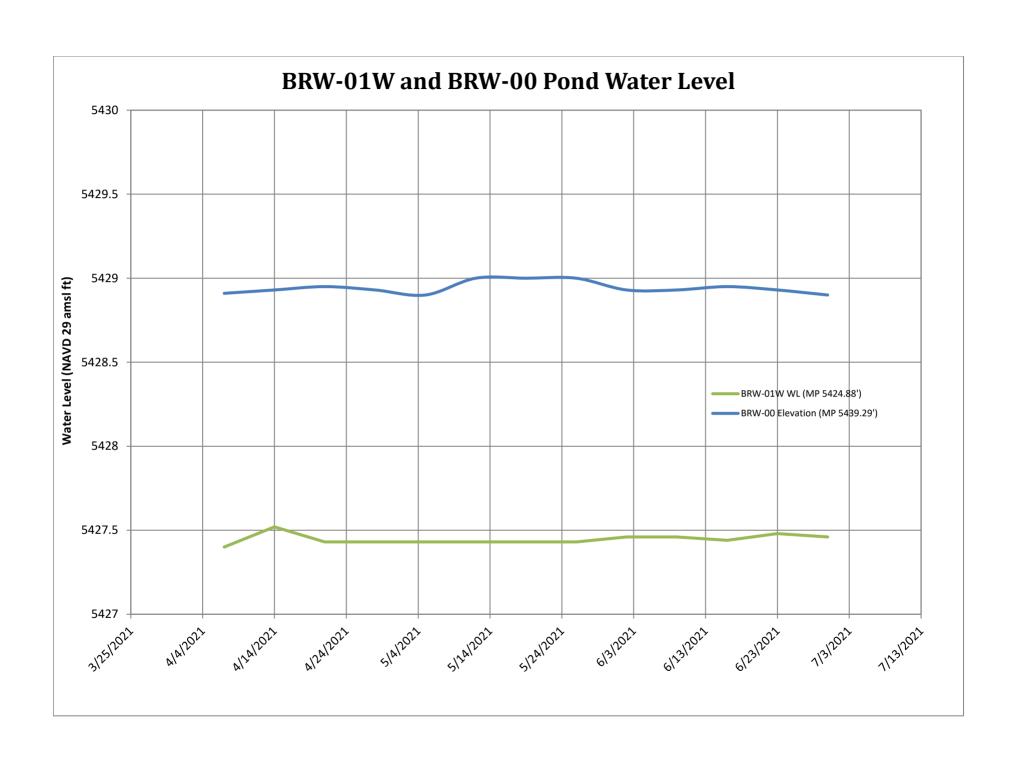

| Date | Actual Lime Rate (mg/L) | Total Lime Used - From Feeder Display (kg) | Calculated Influent Flow Rate (gpm) | Calculated Effluent Flow Rate (gpm) | Date | Actual Lime Rate (mg/L) | Total Lime Used - From Feeder Display (kg) | Calculated Influent Flow Rate (gpm) | Calculated Effluent Flow Rate (gpm) | Date | Actual Lime Rate (mg/L) | Total Lime Used - From Feeder Display (kg) | Calculated Influent Flow Rate (gpm) | Calculated Effluent Flow Rate (gpm) |

ABSTRACT

This second quarter 2021 Data Summary Report (DSR) summarizes the analytical results from compliance sampling at the Butte Priority Soil Operable Unit (BPSOU) Butte Treatment Lagoons (BTL) Lower Area One (LAO) from April 1 to June 30, 2021. All data have undergone a Stage 4 data verification and validation in accordance with U.S. Environmental Protection Agency (EPA) *National Functional Guidelines* [NFG] *for Inorganic Superfund Data Review* (EPA, 2017) and EPA *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* (EPA, 2009). For the quarter, a total of 43 natural samples were collected during 26 sampling events: 26 sampling events included sampling station (SS) LAO-SS-1, 13 sampling events included LAO-SS-2, and 3 sampling events included LAO-SS-3. This resulted in a total of 622 natural data points generated by Pace Analytical Services (Pace). Of the 622 natural data points collected, 552 points (89.0%) were designated as enforcement quality, 70 points (11%) were designated as screening quality, and no data points were rejected based on laboratory and field quality control (QC) sample results.

This DSR was prepared by Pioneer Technical Services, Inc. (Pioneer), 1101 S. Montana St, Butte, Montana 59701 for:

Atlantic Richfield Company 317 Anaconda Road Butte, Montana 59701

The information presented in this DSR includes laboratory analytical results from water samples, related to monitoring activities performed during the second quarter of 2021.

STATEMENT OF AUTHENTICITY

Consistent with the provisions described in the 2020 U.S. EPA BPSOU Consent Decree (CD), which includes the 2006 BPSOU Record of Decision (ROD), the 2011 Explanation of Significant Differences to the 2006 ROD, and 2020 ROD Amendment as Appendix A (EPA, 2020), the data sets in this document are considered to be final data generated or evaluated. Consistent with the aforementioned orders, the signatories below hereby stipulate to the authenticity and accuracy of the data and hereby waive any evidentiary or other objection as to the authenticity and accuracy of reference in endangerment assessments, public health evaluations, feasibility studies, and remedial design/remedial action documents.

EXECUTIVE SUMMARY

This DSR summarizes data collected for the BPSOU BTL during the second quarter 2021 in accordance with the project work documents and long-term monitoring objectives for the BTL.

All sampling activities followed required protocols. Site-specific Standard Operating Procedures (SOPs) developed by Pioneer Technical Services, Inc. (Pioneer) followed the Clark Fork River Superfund Site Investigation (CFRSSI) procedures. The SOPs were followed for sample and data collection along with field and office protocols.

Samples collected were sent to Pace in Minneapolis, Minnesota, for analysis. Pioneer completed Stage 4 data verification and validation. All data included in this quarterly report are provided as final.

Data generated from the samples collected for the quarter sampling events were examined to ensure that project objectives were met. In total, 622 data points were generated from 43 natural samples collected in 26 sampling events: 70 data points were designated screening quality (11.0%) and 552 data points (89.0%) were designated enforcement quality based on laboratory and field QC sample results.

All data presented herein have undergone required Stage 4 data verification and validation.

1.0 INTRODUCTION

This DSR summarizes data collected for the BTL during the second quarter 2021. Specifically, this report summarizes sampling events that occurred from April 1 through June 30, 2021 (referred to as quarter), and provides the following:

 Data collected from weekly, twice weekly, and monthly sampling events throughout the quarter.

Information referenced throughout this DSR is included in the appendices below:

- Appendix A Data Validation Report (DVR)
- Appendix B Field Forms
- Appendix C Laboratory Level 4 Data Packages
- Appendix D Laboratory Data Electronic Data Deliverable Files

All work described in this document was performed as detailed in the BTL Groundwater Treatment System Routine Operation, Maintenance, and Monitoring (OM&M) Plan (Atlantic Richfield Company 2021) (referred to as the *Routine OM&M Plan*). Refer to the Routine OM&M Plan for additional details related to sampling and monitoring tasks. The sampling events were conducted as specified in the BTL groundwater treatment system and subdrain sampling and monitoring Quality Assurance Project Plan (QAPP) (an appendix to the Routine OM&M Plan) (referred to as QAPP herein).

The Pioneer sampling team conducted the sampling and fieldwork during the quarter. Water chemistry samples were collected from sample station locations shown on Figure 1 and identified below by location name, station field identification and sample identification. Sample locations include:

| Sample Station Name | Station Field Identification | Sample Identification |
|-------------------------|------------------------------|--------------------------|
| Effluent sample station | EFS-07 | SS-1 |
| Influent sample station | INF-04 | SS-2 |
| MSD-HCC station | MSD-HCC | SS-3 |

Samples collected were sent to Pace in Minneapolis, Minnesota, for analysis. The laboratory completed data verification and validation according to the laboratory quality procedures. All data included in this quarterly report are provided as final.

Data generated from the samples collected for the quarter were examined to ensure that project objectives were met. In total, 622 data points were generated from 43 natural samples collected in 26 sampling events: 70 data points were designated screening quality (11.0%) and 552 data points (89.0%) were designated enforcement quality based on laboratory and field QC sample results.

Personnel from Pioneer completed the water chemistry sampling activities. The water chemistry data collected had to undergo rigorous sampling and analysis procedures and meet quality QA/QC protocols and documentation requirements to be designated as enforcement quality. All data underwent a Stage 4 verification and validation in accordance with EPA NFG (EPA, 2017) and EPA *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* (EPA, 2009). All data presented herein have undergone data validation in accordance with the CFRSSI Data Management/Data Validation (DM/DV) Plan Addendum (CFRSSI DM/DV Plan Addendum) (AERL, 2000a). Information pertaining to water chemistry, data quality, and data validation is provided in Section 3.0 and Appendix A.

This DSR contains the following information:

- Investigation objectives (Section 1.1).
- Site description and background (Sections 1.2 and 1.3).
- Sampling and analysis summary (Section 2.0).
- Water quality sample collection (Section 2.1).
- Data quality assessment (Section 3.0).
- Project objectives and sampling design review (Section 3.1).
- Preliminary data review (Section 3.2).
- Data verification and validation (Section 3.3).
- Conclusions on the quality of the data (Section 4.0).

Site-specific SOPs were developed by Pioneer in accordance with the CFRSSI SOP (ARCO, 1992a) and are included in the QAPP. The SOPs were followed for sample and data collection along with field and office protocols.

1.1 Objectives

The information compiled in this DSR verifies the data collected under BTL LAO operations. The QAPP identifies the primary monitoring objectives as the following:

- The surface water discharge monitoring activity objective of the BTL groundwater treatment system is to define the frequency, location, and analysis of discharge water quality.
- Document approved methods to sample and analyze water to provide data that are complete, precise, accurate, and defensible.

1.2 Investigation Site Description

The purpose of the BTL is to intercept impacted water from the West Camp Pump Station (WCP-1), Missoula Gulch baseflow, BPSOU subdrain (subdrain), Butte Reduction Works (BRW) groundwater capture, Hydraulic Control Channel (HCC) groundwater capture, and BTL system D-cells and convey it to the BTL collection cell (Cell D4). The water is then pumped from Cell

D4 to the Chemical Addition System building as influent flow, where pre-treatment water quality is monitored at SS-2. The influent flow is mixed with lime slurry to reach a target pH, which allows dissolved heavy metals to precipitate and separate from the collected groundwater as treated water flows through a series of lagoon cells in the remainder of the BTL system. The lime slurry is created by adding dry calcium hydroxide, delivered by an accurate measurement system measured by milligrams of lime (calcium hydroxide) per liter (mg/L) of influent water, to a portion of the influent water. The slurry is then added back to the remainder of the influent, and pH-adjusted influent flow is directed to three parallel lagoon cell systems. Each system consists of three, unlined, open water cells operating in parallel: A, B, and C, where the A system is to the north and C to the south. The primary purpose of the first cell is to allow the chemical reaction to occur, introduce additional carbon dioxide to the system, and to capture sediment and chemical precipitates. A fourth series of smaller, non-treatment cells, the D cells, is to the south of lagoons A2 and A3. The D cells act as hydraulic barriers between the treatment cells and Silver Bow Creek. Treated effluent water is then discharged to Silver Bow Creek at the effluent station, SS-1.

Construction details for the above described treatment system are documented in the *Final Butte Treatment Lagoons and West Camp Pump Station Upgrades Construction Completion Report* (Atlantic Richfield Company, 2014)

1.3 Background

The LAO is located within the BPSOU immediately west of the Butte-Silver Bow municipal water treatment facility on the western edge of the city of Butte in Silver Bow County, Montana. The entire LAO site is approximately 80 acres wide and 1 mile long. Currently, the full-scale water treatment system (BTL system) is operating within the northwest one-quarter of the LAO site as a portion of the final BPSOU remedy. Figure 1 shows the area. Remedial action activities completed in the LAO area in the late 1990s included removing approximately 1.2 million cubic yards of tailings and impacted soils and reconstructing the stream and floodplain. During remedial action activities in 1996, two demonstration wetlands projects were constructed within LAO. One demonstration was discontinued in 2005. The remaining demonstration system has undergone a series of improvements and modifications from 1999 through 2010. The Agency-approved, full-scale, permanent BTL system was constructed between 2011 and 2014. The BTL system can effectively treat Missoula Gulch base flow and WCP-1 groundwater entering the HCC, groundwater collected from the subdrain, groundwater collected from the BRW western areas (BRW-00 and BRW-01W), and groundwater collected within the BTL system at LAO.

2.0 DATA COLLECTION, EQUIPMENT MAINTENANCE, SAMPLING, AND LABORATORY ANALYSES SUMMARY

This section summarizes completed tasks that addressed the monitoring objectives described in the QAPP including sampling methods, field analysis methods, and analytical results for the quarter water chemistry sampling.

2.1 Water Quality Sample Collection

For the sampling events completed during the quarter, field technicians collected samples from the 3 surface water locations. Water chemistry samples were collected and sent to Pace for analysis. Dissolved samples were filtered through a 0.45-micron environmental filter. All sample containers were appropriately labeled with the site identification (ID), sampler, date, time, sample type, and preservation and filtration methods.

The following samples were collected for analysis at each sampling location during the quarter sampling events (Table 2 in the QAPP):

- Filtered water for dissolved metals. Collected in 250-milliliter (mL) Nalgene™ bottles preacidified by the laboratory with nitric acid.
- Raw water for total recoverable metals. Collected in 250-mL Nalgene™ bottles preacidified by the laboratory with nitric acid.
- Raw water for nitrate/nitrite. Collected in 250-mL NalgeneTM bottles pre-acidified by the laboratory with sulfuric acid.
- Raw water for sulfate, alkalinity, total dissolved solids (TDS) and total suspended solids (TSS). Collected in 1 liter NalgeneTM bottles.

2.1.1 Sample Analysis

Water chemistry samples for dissolved metals, total recoverable metals, nitrate/nitrite, sulfate, alkalinity, TDS, TSS, and associated QA/QC samples were packaged and shipped to Pace for analysis. Analytical reports are provided in Appendix C and water chemistry results (including QA/QC samples) and applicable laboratory flags, data validation qualifiers, and reason codes are included in Table A1 through Table A3 of Appendix A.

3.0 DATA QUALITY ASSESSMENT

The Data Quality Assessment (DQA) process (EPA, 2000) objective is to determine whether the project-specific objectives have been satisfied and if the analytical results are acceptable for project decision making. The DQA process consists of five steps that relate the quality of the results to the intended use of the data:

- Step 1: Review sampling design (Section 3.1).
- Step 2: Conduct preliminary data review (Section 3.2).
- Step 3: Select statistical test(s), as appropriate, to evaluate data quality (not applicable).
- Step 4: Verify assumptions (not applicable).
- Step 5: Draw conclusions about the quality of the data (Section 4.0).

3.1 Project Objectives and Sampling Design Review

Project-specific objectives were defined to cover the requirements outlined in the BPSOU CD (and Appendix A of the BPSOU CD) (EPA, 2020) and were used in the sampling design.

3.2 Preliminary Data Review

A preliminary data review was conducted to determine if any problems or anomalies were present in the sample collection and analysis procedures. This was completed by evaluating data quality indicators (Section 3.2.1) followed by data verification and validation (Section 3.3).

3.2.1 Data Quality Indicators

Part of the DQA process is to evaluate the results against data quality indicators of precision, accuracy, representativeness, completeness, comparability, and sensitivity. An evaluation of each data quality indicator follows.

The summary of data points in the following sections includes only the natural samples (the samples collected at EFS-07, INF-04 and MSD-HCC locations) and does not include the field QC samples (the field duplicate and field blank samples). Note that the field QC samples underwent the same data validation procedures as the natural samples and results were included on the data validation checklists (Appendix A). The qualifications made to field QC samples are listed in Table A2 and Table A3 in Appendix A; however, the qualifications made to these samples are not included in the summary of qualifications made to natural data points, and the field QC samples are not included in Table A1.

3.2.1.1 Precision

Precision is the amount of scatter or variance that occurs in repeated measurements of a particular analyte. Acceptance or rejection of precision measurements is based on the relative percent difference (RPD) of the laboratory and field duplicates. For example, perfect precision would be a 0% RPD between duplicate samples (both samples would have the same analytical result). For total metals and wet chemistry analysis, when both results are greater than 5 times the Contract-Required Quantitation Limit (CRQL) acceptable precision is an RPD of plus or minus 20% in water samples. For samples with 1 or both results less than 5 times the CRQL (including non-detect), acceptable precision is met if the absolute difference between the 2 sample results is less than the CRQL. This precision requirement is derived from the Contract Laboratory Program (CLP) Statement of Work (SOW) (EPA, 2016) and the CFRSSI QAPP (ARCO, 1992b). For these sampling events, precision was assessed based on laboratory prepared and field duplicate sample analysis:

$$RPD = \frac{|x - y|}{\frac{(x + y)}{2}} \times 100$$

Where:

x = investigative sample result

y = duplicate sample result

Of the 622 natural data points associated with the quarter sampling events, 13 (2%) of these data points were qualified based on laboratory or field duplicate results that did not meet precision requirements, and the remaining 609 (98%) of the data points met the precision requirements.

3.2.1.2 Accuracy

Accuracy is the ability of the analytical procedure to determine the actual or known quantity of a particular substance in a sample. The percent recovery (%R) of initial calibration verification (ICV) samples, continuing calibration verification (CCV) samples, laboratory control samples (LCS), laboratory matrix spike samples (LMS), Pace's contract-required detection limit (CRDL) check samples, and the percent difference (%D) in the initial calibration standards are used to measure accuracy for metals, the forms of alkalinity, nitrogen (as nitrate [NO2] + nitrite [NO3]), and sulfate data. Perfect recovery would be 100% (the analysis result is exactly the known concentration of the ICV, CCV, LMS, LCS, or check samples). For metals—the forms of alkalinity, nitrogen (as NO2 + NO3), and sulfate data—an acceptable accuracy range for the ICV and CCV recoveries is 90-110%, and the acceptable range for LCS recoveries is 80-120%. For total metals, an acceptable accuracy range for LMS recoveries is 75% to 125% in water samples. For general chemistry analytes, the acceptable range for LMS recoveries, as listed in the CFRSSI QAPP (ARCO, 1992b), is 80-120% in water samples.

The %D between the actual concentration and measured concentration in calibration standards prior to sample analysis is also evaluated when evaluating accuracy. The %D according to the EPA NFG (EPA 2017) needs to be within plus or minus 30%. Calibration information for metals, forms of alkalinity, nitrogen (as NO2 + NO3), and sulfate was provided in the Level 4 data packages. For metals analysis, the %D for the serial dilution samples and the detection of analytes in the interference check samples (ICS) were also used to determine accuracy. Accuracy requirements for this project were derived from the EPA NFG, CLP SOW (EPA, 2016), and the CFRSSI QAPP (ARCO, 1992b).

Field and laboratory blanks were analyzed to assess artifacts introduced during sampling, transport, and/or analyses that may affect the accuracy of the data. In accordance with the CFRSSI QAPP (ARCO, 1992b), a data point is qualified as "U" if it is less than 5 times an associated blank result (initial calibration blank, continuing calibration blank, method blank, or field blank) that is greater than 2 times the method detection limit (MDL).

Data points are often qualified for more than 1 laboratory QA/QC result outside of control limits. As an example, 5 data points for metals analysis were qualified J due to a calibration standard %D outside control limits and a detection in the ICS outside control limits.

Of the 622 natural data points associated with the quarter sampling events, 50 (8%) of these data points were qualified for some combination of ICV, CCV, LCS, and LMS %R and/or calibration and serial dilution %D, a detection in the ICS outside of control limits, and/or a detection in an associated blank outside the control limits. The remaining 572 (92%) data points met the accuracy requirements.

3.2.1.3 Representativeness

Representativeness is a qualitative parameter that is addressed through proper design of the sampling program. The sampling program developed for the QAPP was designed to determine if

treated groundwater quality (at LAO-SS-1) meets the end-of-pipe discharge standards and the effectiveness of the BTL treatment system.

The laboratory results were reviewed, and a Stage 4 data verification and validation completed. Based on information provided by Pace, the chain of custody requirements were met for each of the sample events. Preservation requirements were met for all samples and all samples were analyzed within the appropriate holding times except for the alkalinity analyses in sample delivery group (SDG) 10565397, and the low-level mercury analyses in 10559768. Results were qualified for the holding time exceedance and are considered usable as screening quality data.

3.2.1.4 Completeness

Completeness is assessed to determine if enough valid data have been collected to meet the investigation needs. Completeness is assessed by comparing the number of valid sample results to the number of sample results planned for the investigation. The completeness target for this loading study investigation was 95% or greater as designated in the CFRSSI QAPP (ARCO, 1992b). Samples were collected twice weekly at LAO-SS-1 and once weekly at LAO-SS-2 throughout the quarter. Samples were collected at 1 additional surface water site (LAO-SS-3) once a month. All the required samples were collected. Pace analyzed all the surface water samples for the analytes listed in Table 2 of the QAPP.

In total, 622 natural data points were generated by the sampling events. All the natural data points were usable as no sample results were rejected, 100% of the planned samples were collected, and 100% of the planned analyses were performed. This meets the 95% QA/QC completeness Data Quality Objective (DQO) listed in the CFRSSI QAPP (ARCO, 1992b).

3.2.1.5 Comparability

Comparability is assessed to determine if one set of data can be compared to another set of data. Comparisons are made by examining and comparing the laboratory and field methods used to acquire sample data for different distinct data sets. The data sets summarized in this report include water samples collected by Pioneer and samples analyzed by Pace.

The water quality samples were collected using standard sampling methods and Pioneer SOPs. The sampling design, SOPs, and laboratory analytical methods are based on EPA and other industry standard practices and were documented in the field logbook.

Sample collection was completed by professionals who were properly trained in the SOPs and equipment use. Proper chain of custody and sample handling were observed during sample collection, delivery to the laboratory, and analysis. The analytical laboratories performed the sample analysis using industry standard methods.

Consequently, data from future surface water sampling events at BTL LAO using comparable sampling and analytical methods may be used in concert with this data set.

3.2.1.6 Sensitivity

Sensitivity is a quantitative measure and is evaluated by comparing the laboratory reporting limit (RL) or the laboratory MDL to the project-required detection limit.

To evaluate sensitivity, the required reporting limits (RRL) listed in the Montana Department of Environmental Quality (DEQ) Circular 7 (DEQ-7) (DEQ, 2019) for aluminum, arsenic, cadmium, copper, iron, lead, mercury, silver, zinc, and nitrogen (NO2 + NO3) are compared to the laboratory MDL. The remaining analytes (calcium, magnesium, uranium, hardness, total alkalinity, bicarbonate alkalinity, carbonate alkalinity, hydroxide alkalinity, TDS, TSS, and sulfate) have no RRL listed in a Montana Circular DEQ-7, and do not have Applicable or Relevant and Appropriate Requirements for this project.

The laboratory MDL met the RRL for all applicable analytes except nitrate (as NO2 + NO3). The RRL for nitrate (as NO2 + NO3) is 0.01 mg/L and the Pace MDL was 0.078 mg/L. All the natural sample results for nitrate (as NO2 + NO3) were detections above the MDL. The usability of sample results that had detectable levels of analytes is not affected by an MDL that is higher than the RRL. Additionally, the Montana Circular DEQ-7 (DEQ, 2019) human health standard for nitrate/nitrite is 10 mg/L; therefore, this MDL is considered low enough to meet project needs.

For the samples in SDG 10559768, Pace was unable to perform the low-level mercury analysis (MDL = 0.0047 micrograms per Liter [μ g/L]) within the required hold time (28 days). Pace was instructed to perform the standard mercury analysis (MDL = 0.045 μ g/L) within hold time and the low-level mercury analysis when possible. The low-level mercury analyses were performed with hold times of 32 and 29 days. The low-level mercury results for natural samples were all detections and were qualified "J-" for exceeding the hold time. The low-level mercury results for these samples are usable for the project and met the sensitivity requirement. The RRL for mercury (0.005 μ g/L) was not met for the standard mercury analysis; however, the MDL for the standard mercury analysis was lower than Applicable or Relevant and Appropriate Requirements for mercury (0.05 μ g/L) and so the results are usable for the project.

For analytes without an RRL, the laboratory MDLs are consistent with anticipated MDLs listed in Table 2 of the QAPP; therefore, this MDL is considered low enough to meet project needs.

3.3 Data Verification and Validation

All data presented herein have undergone a Stage 4 data verification and validation in accordance with EPA NFG (EPA, 2017) except when superseded by the CFRSSI DM/DV Plan (ARCO, 1992c) or CFRSSI DM/DV Plan Addendum (AERL, 2000a). Based on the DQA process outlined in the CFRSSI Pilot Data Report Addendum (AERL, 2000b), the quality of the data is ranked as enforcement quality, screening quality, or it is rejected.

Enforcement quality data are supported by rigorous sampling and analysis procedures, QA/QC protocols, and documentation requirements. Enforcement quality data, as defined in the CFRSSI DM/DV Plan (ARCO, 1992c), must meet Level A and Level B criteria (Appendix A) and remain unqualified during the data validation process (no J, J+, UJ, or R qualifications [U qualifications

are still considered enforcement data as these qualifications mean the result is non-detect, not estimated]). Enforcement quality data can be used for all Superfund activities.

Screening quality data, as defined in the CFRSSI DM/DV Plan (ARCO, 1992c), include data that were qualified during the validation process and that met Level A but not Level B criteria. Potential uses of screening quality data, depending on their quality, include site characterization, determining the presence or absence of contaminants, developing or refining sampling and analysis techniques, determining relative concentrations, scoping and planning for future studies, engineering studies and engineering design, monitoring during implementation of the response action, and the ongoing groundwater remedy optimization effort.

Data rejected during data validation cannot be used for any Superfund activities. No results from these sampling events were rejected.

Summaries of the analytical results from samples collected at the BTL site for the quarter sampling events are included in the following tables in Appendix A:

- Table A1 contains the analytical results with laboratory qualifiers; data validation qualifiers; enforcement, screening, and rejected classifications; and data validation reason codes.
- Table A2 contains the field duplicate pair samples with results, laboratory flags, data validation qualifiers, data validation reason codes, and QC criteria calculations.
- Table A3 contains the field blank samples with results, laboratory flags, data validation qualifiers, data validation reason codes, and QC criteria calculations.
- Table A4 contains sample identification information including the field sample name, sample type, sample location, laboratory sample name, sample date, analytical methods, and analytes.
- Table A5 contains the definitions for the laboratory qualifiers; data validation qualifiers; enforcement, screening, and rejected classification codes; and data validation reason codes.

The data validation checklists for the quarter sampling events for total metals, as well as general chemistry analyses, are included in Appendix A as Attachments A1 and A2, respectively. The Level A/B assessment checklist for the sampling events is included in Appendix A as Attachment B. The checklists are from the CFRSSI DM/DV Plan Addendum (AERL, 2000a). The data were validated according to the EPA NFG (EPA, 2017) except when superseded by the CFRSSI DM/DV Plan (ARCO, 1992c) and Addendum.

As shown in the Level A/B checklist in Appendix A (Attachment B), all the samples met both Level A and Level B criteria. No data were designated screening quality or rejected based on the results of Level A/Level B criteria. In Appendix A, Table A1 shows the enforcement, screening, or unusable designators for each natural data point.

Data were also evaluated using the Level A/B Checklists (Appendix A). All samples met both the Level A and Level B criteria defined in the CFRSSI DM/DV Plan (ARCO, 1992c) and CFRSSI DM/DV Plan Addendum (AERL, 2000a). Based on the qualifications and the Level A/B checklist, 23 data points were classified as screening quality (J, J+, or UJ qualifier).

Of the 622 natural data points generated by Pace for the quarter samples, 552 (89%) of the natural data points were considered enforcement quality and 70 (11%) natural data points were classified as screening quality. In Appendix A, Table A1 show the laboratory flags, data validation qualifiers, enforcement or screening designators, and the reason code for the qualification for each of the data points.

3.3.1 Laboratory Quality Control Samples

Based on information provided by Pace, the chain of custody requirements were met for the quarter sampling events. Receiving temperatures of samples for both events were within control limits and the samples were analyzed within the appropriate holding times. All required laboratory QA/QC samples were analyzed with each SDG, and 66 data points from the quarter events were qualified due to laboratory QA/QC sample results outside of control limits. The qualifications required based on the laboratory QC sample results are detailed in Appendix A in Attachment A1 and A2 and listed in Table A1.

3.3.2 Field Quality Control Samples

The quarter samples were collected following the requirements in the QAPP: 1 field duplicate and 1 field blank collected each month during a sampling event. During the events, 3 field duplicate and 3 field blanks were collected. The results for field QC samples are listed in Table A2 and Table A3. Qualifications required because of field QC sample results are detailed in Appendix A and listed in Table A1.

3.3.2.1 Field Blank Results

Field blank results are used to provide a measure of the effectiveness of field decontamination and help evaluate the cleanliness of disposable field equipment. Field blank results are listed in Table A3 in Appendix A.

Three field blank associated with the samples were submitted for analysis for the quarter sampling events. Although there were positive detections in the field blank result for calcium and magnesium in February greater than 2 times the MDL, no qualifications were warranted because all associated sample results were greater than 5 times the respective blank detections.

3.3.2.2 Field Duplicate Results

Field duplicates are used to assess field and laboratory precisions. Field duplicate results are listed in Table A2 in Appendix A. One field duplicate sample was submitted with the samples from each of the quarter events. The field duplicate samples were not analyzed for dissolved barium and dissolved silica. Therefore, the dissolved barium and dissolved silica results for both sampling events were qualified "J" due to not meeting the field duplicate collection frequency requirement. The remaining analytes met the requirements of 1 field duplicate collected per sampling event.

Sample results qualified "J" for poor field precision or for not meeting the field duplicate collection frequency requirement were assigned an FD or FDX reason code, respectively, in the results tables in Appendix A.

4.0 DATA QUALITY CONCLUSIONS

The laboratory samples were collected using standard sampling methods and in accordance with relevant Pioneer SOPs. The sampling design, SOPs, and laboratory analytical methods were based on EPA and other industry standard practices. Sample collection was completed by professionals who were properly trained in following SOPs and using equipment. Proper chain of custody and sample handling activities were observed during sample collection, delivery to the laboratory, and analysis. The analytical laboratories performed the sample analyses using industry standard methods. As shown in the checklists (Appendix A), all data met the Level A and Level B criteria.

Data generated from the samples collected for the quarter sampling events were examined to ensure that project objectives were met. The DQOs for the investigation are listed in the QAPP. A data QA/QC review was completed for each of the quarter sampling events

In total, 622 data points were generated by the 26 sampling events: 70 (11%) natural data points were designated screening quality and 552 (89%) natural data points were designated as enforcement quality based on laboratory and field QA/QC sample results (Appendix A).

4.1 Deviations

During the quarter events, there was two deviation to the QAPP:

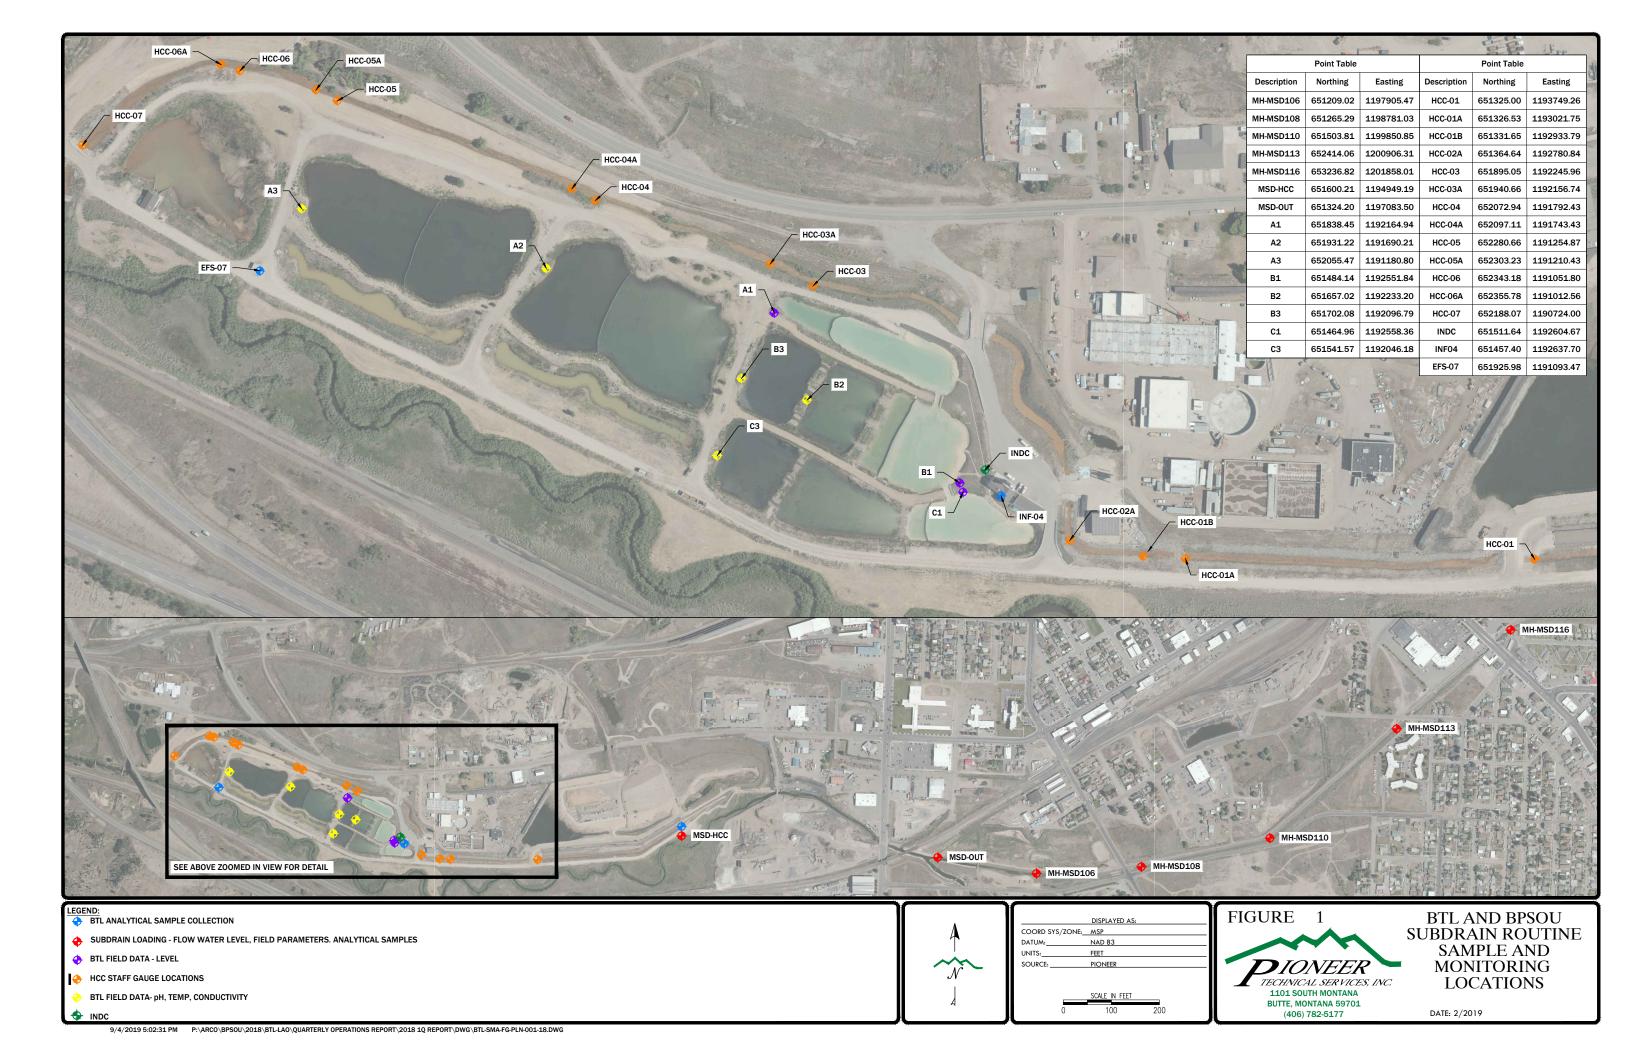

Field grab samples were collected on April 8, 12, 15, 19, 22, and 26, 2021, at EFS-07 due to issues with the ISCO sampler and sample pump.

For the samples in SDG 10559768 collected on May 6 and May 10, 2021, Pace was unable to perform the low-level mercury analysis (MDL = $0.0047~\mu g/L$) within the required hold time (28 days). Pace was instructed to perform the standard mercury analysis (MDL = $0.045~\mu g/L$) within hold time and the low-level mercury analysis when possible. The low-level mercury analyses were performed with hold times of 32 and 29 days.

1.0 DATA VALIDATION REPORT SUMMARY

This validation report summarizes the analytical results from samples collected for the compliance sampling at the Butte Treatment Lagoons (BTL) Lower Area One (LAO) from April 1, 2021, through June 30, 2021 (referred to as quarter). All data have undergone a Stage 4 data validation in accordance with the BTL groundwater treatment system and Butte Priority Soils Operable Unit (BPSOU) subdrain (subdrain) Quality Assurance Project Plan (QAPP) (Atlantic Richfield, 2021) (referred to as QAPP) and U.S. Environmental Protection Agency (EPA) National Functional Guidelines [NFG] for Inorganic Superfund Data Review (EPA, 2017). The samples were labelled according to EPA Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use (EPA, 2009). All data presented herein have undergone data validation in accordance with the Clark Fork River Superfund Site Investigation (CFRSSI) Data Management/Data Validation (DM/DV) Plan Addendum (CFRSSI DM/DV Plan Addendum) (AERL, 2000). This report details the evaluation of laboratory reported data for the purpose of usability.

This document refers to the tables and attachments below.

- Table A1 contains the analytical results with laboratory qualifiers; data validation qualifiers; enforcement, screening, and rejected classifications; and data validation reason codes.
- Table A2 contains the field duplicate pair samples with results, laboratory flags, data validation qualifiers, data validation reason codes, and quality control (QC) criteria calculations.
- Table A3 contains the field blank samples with results, laboratory flags, data validation qualifiers, data validation reason codes, and QC criteria calculations.
- Table A4 contains sample identification information including the field sample name, sample type, sample location, laboratory sample name, sample date, analytical methods, and analytes.
- Table A5 contains the definitions for the laboratory qualifiers; data validation qualifiers; enforcement, screening, and rejected classification codes; and data validation reason codes.
- Attachment A contains the data validation checklists.
- Attachment B contains the Level A/B Assessment Checklist.

The full data packages received from the laboratory provided the information to perform a Stage 4 data validation. All data met the Level A and B criteria. Based on the validation process outlined in the CFRSSI DM/DV Plan (ARCO, 1992a), the quality of the data is ranked as enforcement quality, screening quality, or it is rejected. Enforcement quality data are defined in the CFRSSI DM/DV Plan as data that meet the Level A and B criteria (Attachment B) and are not qualified as estimated or rejected after the data validation process. For sample results qualified as estimated "J" by the laboratory because the reported result is between the method

detection limit (MDL) and analytical reporting limit (RL), values are considered enforcement data if no other qualifiers were required during validation. During data validation, results between the MDL and RL were assigned a Reason Code of "<RL" and, if no other qualifiers were required, were qualified "A" as defined in the CFRSSI DM/DV Plan (ARCO, 1992a) to indicate enforcement quality data. Enforcement quality data may be used for all purposes under the Superfund program including the following: site characterization, health and safety, Engineering Evaluation/Cost Analysis, remedial investigation/feasibility studies, evaluation of alternatives, confirmational purposes, risk assessments, and engineering design. As all samples met the Level A and B documentation criteria, the results that were not qualified as estimated (J, J+, J-, or UJ) or rejected for some exceedance of quality assurance (QA)/QC criteria were considered "enforcement" quality data and were assigned an "E" in Table A1.

Screening quality data, as defined in the CFRSSI DM/DV Plan (ARCO, 1992a), are those samples that do not meet the Level B criteria and/or were qualified as estimated (J, J+, J-, or UJ) during the data validation process. Potential uses of screening quality data, depending on their quality, include site characterization, determining the presence or absence of contaminants, developing or refining sampling and analysis techniques, determining relative concentrations, scoping and planning for future studies, engineering studies and engineering design, and monitoring during implementation of the response action. Sample results that were qualified as estimated during the validation process were considered "screening" quality data and assigned an "S" in Table A1.

Data rejected during data validation cannot be used for any Superfund activities. No results were rejected.

For the compliance sampling activities, samples were collected twice weekly at the lagoon discharge of the BTL LAO at station EFS-07 (sample number LAO-SS-1). Once a week, a sample was collected from the influent station INF-04 (sample number LAO-SS-2). Once a month, an additional sample was collected at the subdrain discharge at station MSD-HCC (sample number LAO-SS-3). The samples were sent weekly to Pace Analytical Services, Inc. (Pace) in Minneapolis, Minnesota. All the samples were analyzed for total recoverable aluminum, arsenic, cadmium, calcium, copper, iron, lead, magnesium, mercury, total hardness, silver, uranium, and zinc. Additionally, once a month samples were analyzed for total alkalinity, bicarbonate alkalinity, carbonate alkalinity, hydroxide alkalinity, sulfate, nitrogen (as nitrate [NO2] + nitrite [NO3]), total suspended solids (TSS), and total dissolved solids (TDS).

The summary of data points in this Data Validation Report includes only the natural samples (the samples collected at EFS-07 [LAO-SS-1], INF-04 [LAO-SS-2], and MSD-HCC [LAO-SS-3]) and does not include the field QC samples (the field duplicate and field blank samples). Note that the field QC samples underwent the same data validation procedures as the natural samples and are included on the data validation checklists in Attachment A. The qualifications made to field QC samples are listed in Table A2 and Table A3; however, the qualifications made to these samples are not included in the summary of qualifications made to natural data points, and the field QC samples are not included in Table A1.

In the quarter, a total of 43 natural samples were collected during 26 sampling events. The 26 sampling events included EFS-07 (LAO-SS-), 13 sampling events included INF-04 (LAO-SS-2), and 3 sampling events included MSD-HCC (LAO-SS-3). This resulted in a total of 622 natural data points generated by Pace. A summary by sample location is shown below:

Summary of Enforcement and Screening Quality Data Points from Each Sample Location

| Sample Location | Samples | Data Points | Enforcement Data Points (% of total) | Screening Data Points (% of total) | Rejected Data Points (% of total) |
|---------------------------|---------|-------------|--|------------------------------------|---|
| EFS-07 (LAO-SS-1)* | 26 | 364 | 309 (85%) | 55 (15%) | 0 |
| INF-04 (LAO-SS-2) | 13 | 194 | 186 (96%) | 8 (4%) | 0 |
| MSD-HCC (LAO-SS-3) | 3 | 64 | 57 (89%) | 7 (11%) | 0 |
| Total for Natural Samples | 42 | 622 | 552 (89%) | 70 (11%) | 0 |

^{*} Compliance sampling point

Table A1 shows the laboratory flags, data validation qualifiers, enforcement or screening designators, and the reason code for the qualification for each data point.

2.0 QUALITY ASSURANCE/QUALITY CONTROL REVIEW OF INORGANIC DATA

Data validation checklists derived from the CFRSSI DM/DV Addendum (AERL, 2000) were completed for each of the weekly and monthly laboratory reports (Attachment A). Below are the deviations made to the checklists provided in the CFRSSI DM/DV Addendum guidance document:

- The Laboratory Data Validation Checklist for Metals Analysis by Inductively Coupled Plasma (ICP) or Graphite Furnace Atomic Absorption Spectrometry (GFAA) was revised slightly to more accurately reflect the information provided in the full data package provided by Pace and the requirements listed in the NFG (EPA, 2017). The checklist is included in Attachment A.1.
- The Data Validation Checklist for Field Quality Control was not filled out for each data package. Sections on field blanks and field duplicates were added to each Laboratory Data Validation Checklist worksheet.
- The Laboratory Data Validation Checklist for Metals Analysis by ICP or GFAA was modified for the general chemistry validation. The checklist is included in Attachment A.2. The guidelines for general or wet chemistry laboratory QA and QC listed in Table 11-5 of the CFRSSI QAPP (ARCO, 1992b) along with laboratory QA/QC control limits were used in evaluating the general chemistry results. The revised checklist more accurately reflects the information provided by the laboratory for these analyses.

The relevant data validation checklists were completed for each sample delivery group (SDG) and included the data validation performed for the methods and analytes listed below:

| Data Validation Checklist | Method | Analyte(s) | | |
|---------------------------|---------------|--|--|--|
| Metals | EPA 200.8 | Aluminum, arsenic, cadmium, calcium, copper, iron, lead, magnesium, silver, total hardness by 2340b, uranium, zinc | | |
| | EPA 245.1 | Mercury | | |
| | SM 2320B | Total alkalinity, bicarbonate alkalinity, carbonate alkalinity, hydroxide alkalinity | | |
| | SM 2540C | Total Dissolved Solids | | |
| General Chemistry | SM 2540D | Total Suspended Solids | | |
| | SM 4500-NO3-H | Nitrogen (as NO2 + NO3) | | |
| | ASTM D516 | Sulfate | | |

One Level A/B Assessment was completed for all samples (Attachment B).

2.1 Field Quality Control Samples

The QAPP requirement for field duplicate collection frequency is 1 field duplicate sample per month, and the field blank collection frequency requirement is 1 per month.

The analytical RLs presented in the laboratory reports were used to evaluate the field duplicates. The field duplicate QC criteria calculations are listed in Table A2. The laboratory MDLs were used for the data review and validation of field blanks. The field blank results are listed in Table A3.

Any qualifications required based on the field QC sample results are detailed in the Data Validation Checklists (Attachment A) and are listed in Table A1 and Table A2

Please note that although the field QC samples (field duplicate and field blank samples) may receive a qualifier during the data validation process, the enforcement and screening quality summaries and the precision and accuracy assessment summaries do not include the field QC sample results. Only the results of the natural samples are included in the data quality assessment summaries.

2.1.1 Field Duplicate

Field duplicate samples were collected during each monthly sampling event; therefore, the collection frequency requirement for field duplicates was met.

If the field duplicate was collected from the EFS-07 (LAO-SS-1) sample location (effluent) and the results did not meet the field duplicate control limit, the result for both EFS-07 samples collected that week and the field duplicate results were qualified. If the field duplicate was collected at the INF-04 (LAO-SS-2) sample location (influent) and the results did not meet the field duplicate control limit, only the parent sample and the field duplicate result were qualified.

Table A2 contains the field duplicate pairs and the QC criteria calculations. Any qualifications required based on the field duplicate sample results are detailed in the data validation checklists (Attachment A) and are listed in Table A1 and Section 5.1.

2.1.2 Field Blanks

Field blank samples (bottle blanks and rinsate blanks) were collected during each monthly sampling event; therefore, the collection frequency requirement for field blanks was met.

The results of the field blanks are listed in Table A3. The rinsate blanks were collected from the dedicated sampler at EFS-07 (LAO-SS-1). If the results did not meet the field blank control limit, the results for both samples at EFS-07 collected that week were evaluated for qualifications.

Any qualifications required based on the field blank sample results are detailed in the data validation checklists (Attachment A) and are listed in Table A1 and Section 5.2.

2.2 Laboratory Quality Control Samples

The laboratory QC sample types vary depending on analytical method. The QC criteria used during data validation to evaluate the applicable laboratory QC samples are listed in Table 5 of the QAPP.

The Stage 4 data validation includes the evaluation of the following laboratory QC items as applicable per analytical method:

- Holding Times
- Preservation
- Tuning
- Calibration
- Initial Calibration Verification (ICV) and Continuing Calibration Verification (CCV) Standards
- Low Level Initial Calibration Verification Standards (LLICV) (also referred to as the Contract Required Detection Limit [CRDL] standards)
- Initial Calibration Blank (ICB) and Continuing Calibration Blank (CCB) Standards
- Method Blanks (MB)
- Interference Check Samples (ICS)
- Laboratory Control Sample (LCS) and LCS Duplicates (LCSD)
- Laboratory Duplicate Samples (LDS)
- Laboratory Matrix Spike (LMS), LMS duplicates (LMSD), and Post Digestion Spike Samples (PDS)
- Serial Dilution (SD)
- Internal Standards

The laboratory method detection limits (MDLs) were used for the data review and validation of laboratory method blanks and field blanks; and the laboratory instrument detection limits were used for the data review and validation of the laboratory instrument blanks (initial and continuing calibration blanks) as discussed in the CFRSSI QAPP (ARCO, 1992b).

The appropriate laboratory QC samples were analyzed with each sample group. Any qualifications required based on the laboratory QC sample results are detailed in the data validation checklists (Attachment A) and are listed in Table A1. Also refer to Section 5.1 and Section 5.2.

3.0 DEVIATIONS TO NATIONAL FUNCTIONAL GUIDELINES REQUIREMENTS

Below is a summary of discrepancies noted during the validation process between the requirements listed in the NFG (EPA, 2017) and Pace's responses to the deviation:

- Per the NFG "The analyte concentrations in the CCV standard shall be different than the concentration used for the ICV standard." Pace used the same standard for both the ICV standard and CCV standard; however, calibration standards were prepared using a separate source standard solution. "The ICV and CCV are prepared from the same stock standard and analyzed at the same concentration as outlined in our Standard Operating Procedure, S- MN-I-492 rev.27, table 10.2" (per communication with Pace Project Manager, Bob Michels).
- The NFG indicates at least 1 of the calibration standards be at or below the RL, but above the MDL. This was not the case for most of the calibrations reported. In response to this question Pace replied: "The calibration sequence[s] for the ICP-MS instrumentation were initially set up in accordance to method 200.8 and were done with assistance of the instrument vendor upon installation of the equipment. Section 7.4.1 in EPA method 200.8 revision 5.4 recommends 'element concentrations in the standards should be sufficiently high to produce good measurement precision and to accurately define the slope of the response curve. Depending on the sensitivity if the instrument, concentrations ranging from 10-200 ug/L are suggested.' We have increased the calibration range of our instruments because of the observed sensitivity and performance of the instrument(s). The lower end of the calibration is verified daily with the analysis of a reporting limit check standard (CRDL). This is analyzed immediately following the initial calibration verification (ICV) and initial calibration blank (ICB)."
- The calibration blank and 4 calibration standard results were reported for some of the U-238 calibrations throughout the year. As directed in the NFG, 5 calibration standards are required. Pace generally uses only 4 standards for U-238 calibration per their reply on 1/15/2018: "The stock standard used for creating cal-5 standard does not contain uranium. These stock standards were determined at a corporate level and implemented consistently across the Pace network as standard practice."

Based on the above reply, if 4 standards for the U-238 calibration were reported, no results were qualified.

• The NFG requires at a minimum 5 internal standards from the following list: lithium, scandium, yttrium, rhodium, indium, terbium, holmium, lutetium, and bismuth. Pace used germanium, indium, iridium, scandium, terbium, and thorium as their internal standards. Pace's reply: "Elements selected for internal standardization are outlined in Pace SOP S-MN-I- 492 Rev. 27, attachment II. Recommended internal standard elements were selected for use if samples did not contain significant native amounts or if the recommended internal standard were a reportable element. Alternative elements for the appropriate mass range were selected for use based on performance, these include Ge and Th."

Pace updated their internal standard list (per ENV-SOP-MIN4-0043, "Metals Analysis by ICP/MS-Method 6020 and 200.8") to replace thorium with iridium, in order to analyze thorium as an analyte of interest. The internal standard change started in May 2021 and did not affect the quality of data. The recoveries of these elements in each data package could be easily compared. No qualifications were made based on the use of the different internal standards.

• The NFG requires the following for calibration: "A blank and at least five calibration standards shall be used to establish each calibration curve...The curve must have a correlation coefficient of ≥ 0.995. The calculated percent differences (%Ds) for all of the non-zero standards must be within ±30% of the true value of the standard." The majority of qualifications made during the quarter validation effort were due to the %D for calibration standards being greater than 30%. Pace was asked about the number of standards exceeding the %D requirement in the NFG. Pace replied, "They are not a CLP laboratory and our data quality objectives may differ from those requirements specified within the National Functional Guidelines for Inorganic Review, 2017. Our data quality objectives are guided by BP Tech specs (where applicable), the method, and our internal SOP. The established acceptance criteria specific to the initial calibration is a correlation coefficient of ≥ 0.998 where we do not have a %D requirement established for each non-zero standard."

The %D for the calibration standard was not evaluated since Pace is not a Contract Laboratory Program (CLP) laboratory. Calibrations were evaluated during data validation following the QC criteria based on the applicable Pace Standard Operating Procedure (SOP) and are listed in Table 5 of the QAPP.

4.0 LEVEL A/B ASSESSMENT SUMMARY

Data that meet the Level A and Level B criteria and are not qualified as estimated or rejected are assessed as enforcement quality data and can be used for all Superfund purposes and activities. Data that meet only the Level A criteria and are not rejected can be assessed as screening quality data.

Screening quality data can be used only for certain activities, which include engineering studies and design. Data that do not meet both the Level A and B criteria are designated as unusable.

One Level A/B assessment checklist for all samples submitted to Pace for the quarter is included as Attachment B.

As this is compliance data, samples were collected and logged into an electronic spreadsheet. Water quality parameters collected from the sample point during the collection of the samples from the automatic samplers were stored on the meter, downloaded to the computer, and then recorded in a field book. Associated calibration information, sampler's initials, and date and time were also recorded in the field book. This information was reviewed for the Level A/B criteria.

As shown in Attachment B, all the samples met both Level A and Level B criteria. No data were designated screening quality or rejected based on the results of Level A/B assessment.

5.0 PRECISION, ACCURACY, REPRESENTATIVENESS, COMPLETENESS, COMPARABILITY, AND SENSITIVITY DATA SUMMARY

Data generated from the samples collected were examined to ensure that project objectives were met. The data quality objectives (DQO) for this investigation are listed in Section 2.4.1 of the QAPP. A Stage 4 QA/QC review was completed for each sample event.

For the quarter, the 26 sampling events resulted in 42 natural samples collected from 3 surface water sites. Additionally, 6 field blanks and 3 field duplicate samples were collected. The samples were shipped to Pace and analyzed for total recoverable aluminum, arsenic, calcium, cadmium, copper, iron, lead, magnesium, mercury, silver, uranium, zinc, and total hardness. Additionally, once-a-month samples were analyzed for total alkalinity, bicarbonate alkalinity, carbonate alkalinity, hydroxide alkalinity, sulfate, nitrogen (as NO2 + NO3), TSS, and TDS.

5.1 Precision

Precision is the amount of scatter or variance that occurs in repeated measurements of a particular analyte. Acceptance or rejection of precision measurements is based on the relative percent difference (RPD) of the laboratory and field duplicates. For example, perfect precision would be a 0% RPD between duplicate samples (both samples have the same analytical result) for results that are greater than 5 times the RL. For total metals and wet chemistry analysis, when both results are greater than 5 times the RL, acceptable precision is a RPD of plus or minus 20% in water samples. For samples with 1 or both results less than 5 times the RL (including non-detect), acceptable precision is met if the absolute difference between the 2 sample results is less than the RL. This precision requirement is derived from the CLP Statement of Work (SOW) (EPA, 2016) and the CFRSSI QAPP (ARCO, 1992b). For these sampling events, precision was assessed based on laboratory prepared and field duplicate sample analysis.

There were 9 instances where the field duplicate pair results did not meet the control limit. This resulted in the qualification of 13 natural data points due to poor field precision (9 qualifications were made to the parent samples and 4 additional qualifications were made to natural samples considered sufficiently similar to a parent sample). There were no instances where the laboratory duplicate pair results did not meet the control limit.

The natural samples qualified for poor field precision (DV Reason Code = FD) are listed below:

| | | | | | | DV |
|----------|-------------|-----------------|-----------|---------------------------------|------|-----------------------|
| | Lab Sample | | | | DV | Reason |
| SDG | ID | Field Sample ID | Method | Analyte | Flag | Code |
| 10556183 | 10556183002 | LAO-SS-1-041921 | SM 2320B | Alkalinity, Bicarbonate (CaCO3) | J | FD |
| 10559768 | 10559768001 | LAO-SS-1-050621 | EPA 200.8 | Aluminum | J | FD, <rl< td=""></rl<> |

| 10559768 | 10559768002 | LAO-SS-1-051021 | EPA 200.8 | Aluminum | J | FD, <rl< td=""></rl<> |
| 10559768 | 10559768002 | LAO-SS-1-051021 | EPA 200.8 | Copper | UJ | RB, FD |
| 10559768 | 10559768002 | LAO-SS-1-051021 | EPA 200.8 | Lead | J | ICS, FD |
| 10559768 | 10559768002 | LAO-SS-1-051021 | EPA 200.8 | Zinc | J | FD |
| 10565397 | 10565397002 | LAO-SS-1-061421 | SM 2320B | Alkalinity, Bicarbonate (CaCO3) | J | H, FD |
| 10565397 | 10565397002 | LAO-SS-1-061421 | SM 2320B | Alkalinity, Carbonate (CaCO3) | UJ | H, FD |

This resulted in 13 (2%) of the 622 natural data points associated with the natural samples collected during the quarter that did not meet the precision requirements, and 609 (98%) of the 622 natural data points associated with the natural samples collected that met the precision requirements.

5.2 Accuracy

Accuracy is the ability of the analytical procedure to determine the actual or known quantity of a particular substance in a sample.

The indicator of accuracy evaluated during the Stage 4 data validation of the analytical data is below:

| Indicator of Accuracy | Applicable analytical method |
|-----------------------|--|
| Field Blank | |
| MB | EPA 200.8, EPA 245.1, SM 4500-NO3-H, SM 2320B, ASTM D516, SM 2540C/D |
| LCS | EPA 200.6, EPA 243.1, 31VI 4300-1403-11, 31VI 2320B, A311VI D310, 31VI 2340C/D |
| LMS | |
| Calibration | |
| ICV and CCV | EPA 200.8, EPA 245.1, SM 4500-NO3-H, SM 2320B, ASTM D516 |
| ICB and CCB | |
| LLICV | EPA 200.8, EPA 245.1 |
| Tuning | |
| ICS | EPA 200.8 |
| internal standards | EPA 200.0 |
| SD | |

The QC criteria used during data validation for each QC sample are listed in Table 5 of the QAPP.

Field and laboratory blanks were analyzed to assess artifacts introduced during sampling, transport, and/or analyses that may affect the accuracy of the data. In accordance with the CFRSSI QAPP (ARCO, 1992b), a data point is qualified as U if it is less than 5 times an associated blank result (field blank, ICB, CCB, or MB) that does not meet the control limit.

The percent recoveries (%R) of the ICV, CCV, LLICV, ICS, LCS, and LMS are used to measure accuracy. The ICV, CCV, and LLICV measure instrument accuracy. The ICS is used to measure potential instrument interferences that can affect accuracy. The LCS measures sample preparation and analysis accuracy. The LMS measures the effect that the sample matrix has on accuracy. Perfect %R would be 100% (the analysis result is exactly the known concentration of the spike amount in the ICV, CCV, LLICV, LMS, or LCS).

An instrument tune or calibration that does not meet the criteria can affect the accuracy of analytical results.

The %D of the SD sample is used to measure the effect that the sample matrix has on accuracy. Perfect %D would be 0% (the analysis result is exactly the known concentration of the original sample prior to dilution).

The percent relative intensity of the internal standards for EPA 200.8 is used to determine the existence and magnitude of instrument drift and physical interferences of each sample that may affect the accuracy of the data.

Additionally, for the ICS, the detection of analytes not present in the ICS solution with an absolute value above the MDL measures the accuracy of analytes with concentrations that approximate those levels found in the ICS for samples with comparable or higher levels of interferents. Positive detections in the ICS solutions indicate the possibility of false positive results, and negative detections in the ICS indicate the possibility of false negative results for samples with high levels of interferents. For example, the BTL-LAO samples typically have concentrations of the interferent calcium greater than the amount of calcium in the ICS solutions and concentrations of lead, silver, and cadmium near the MDL. Therefore, lead, silver, and cadmium results are often qualified as estimate due to ICS results that indicate potential interferences for these analytes.

For the quarter data, qualifications were made to natural samples due to calibration (linear range, ICV, and CCV), ICS, LMS/LMSD, SD, and field blank control limit exceedances. These qualifications are detailed in the data validation checklists for each SDG in Attachment A. There were no qualifications made due to the remaining indicator of accuracy.

There were 8 natural data points qualified due to reasons related to calibration. One natural data point was qualified because the linear range of the calibration was exceeded (Reason Code = CL). Seven natural data points were qualified due an exceedance of the %R for the ICV and/or CCV (Reason Code = ICV and CCV) as listed below:

| SDG | Lab Sample ID | Field Sample ID | Method | Analyte | DV Flag | DV Reason Code |
|----------|---------------|-----------------|-----------------|---------|---------|------------------------|
| 10556183 | 10556183001 | LAO-SS-1-041521 | EPA 245.1 | Mercury | UJ | CCV |
| 10556183 | 10556183002 | LAO-SS-1-041921 | EPA 245.1 | Mercury | J- | CCV, <rl< td=""></rl<> |
| 10556183 | 10556183002 | LAO-SS-1-041921 | ASTM D516-90-02 | Sulfate | J- | ICV, CCV |
| 10556183 | 10556183004 | LAO-SS-2-041921 | ASTM D516-90-02 | Sulfate | J- | ICV, CCV |
| 10556183 | 10556183005 | LAO-SS-3-041921 | ASTM D516-90-02 | Sulfate | J- | ICV, CCV |
| 10559768 | 10559768004 | LAO-SS-2-051021 | ASTM D516-90-02 | Sulfate | J- | CCV |
| 10559768 | 10559768005 | LAO-SS-3-051021 | ASTM D516-90-02 | Sulfate | J- | CCV |
| 10567614 | 10567614003 | LAO-SS-2-062821 | EPA 200.8 | Copper | J | CL |

There were 25 natural data points qualified for an ICS detection as listed below:

| SDG | Lab Sample ID | Field Sample ID | Method | Analyte | DV Flag | DV Reason Code |
|----------|---------------|-----------------|-----------|---------|---------|----------------|
| 10554243 | 10554243001 | LAO-SS-1-040121 | EPA 200.8 | Lead | J+ | ICS |

| 10565397 | 10565397002 | LAO-SS-1-061421 | EPA 200.8 | Lead | UJ | ICS, RB |
| 10566549 | 10566549002 | LAO-SS-1-062121 | EPA 200.8 | Lead | J+ | ICS |
| 10567614 | 10567614001 | LAO-SS-1-062421 | EPA 200.8 | Lead | J+ | ICS |

There were 4 natural data points qualified due to an exceedance of the %R for the LMS and/or LMSD (Reason Code = S%) as listed below:

| | Lab Sample | | | | DV | DV Reason |
|----------|-------------|-----------------|-----------------|----------------------------|------|--------------|
| SDG | ID | Field Sample ID | Method | Analyte | Flag | Code |
| 10559768 | 10559768002 | LAO-SS-1-051021 | SM 2320B | Alkalinity, Total as CaCO3 | J- | S% |
| 10559768 | 10559768002 | LAO-SS-1-051021 | SM 4500-NO3-H | Nitrogen, NO2 plus NO3 | J- | S% |
| 10565397 | 10565397002 | LAO-SS-1-061421 | SM 4500-NO3-H | Nitrogen, NO2 plus NO3 | J- | S% |
| 10565397 | 10565397002 | LAO-SS-1-061421 | ASTM D516-90-02 | Sulfate | J+ | S% |

There were 8 natural data points qualified due to an exceedance of the %D for the SD (Reason Code = SD) as listed below:

| SDG | Lab Sample ID | Field Sample ID | Method | Analyte | DV Flag | DV Reason Code |
|----------|---------------|-----------------|-----------|-----------|---------|----------------|
| 10554243 | 10554243001 | LAO-SS-1-040121 | EPA 200.8 | Calcium | J | SD |
| 10554243 | 10554243002 | LAO-SS-1-040521 | EPA 200.8 | Calcium | J | SD |
| 10565397 | 10565397001 | LAO-SS-1-061021 | EPA 200.8 | Uranium | J | SD |
| 10565397 | 10565397002 | LAO-SS-1-061421 | EPA 200.8 | Uranium | J | SD |
| 10566549 | 10566549001 | LAO-SS-1-061721 | EPA 200.8 | Copper | J | SD |
| 10566549 | 10566549001 | LAO-SS-1-061721 | EPA 200.8 | Magnesium | J | SD |
| 10566549 | 10566549002 | LAO-SS-1-062121 | EPA 200.8 | Copper | J | SD |
| 10566549 | 10566549002 | LAO-SS-1-062121 | EPA 200.8 | Magnesium | J | SD |

There were 7 natural data points qualified due to an exceedance of a rinsate blank (Reason Code = RB) as listed below:

| SDG | Lab Sample ID | Field Sample ID | Method | Analyte | DV Flag | DV Reason Code |
|----------|---------------|-----------------|-----------|----------|---------|----------------|
| 10556183 | 10556183001 | LAO-SS-1-041521 | EPA 200.8 | Lead | U | RB |
| 10556183 | 10556183002 | LAO-SS-1-041921 | EPA 200.8 | Lead | U | RB |
| 10559768 | 10559768001 | LAO-SS-1-050621 | EPA 200.8 | Copper | UJ | RB, FD |
| 10559768 | 10559768002 | LAO-SS-1-051021 | EPA 200.8 | Copper | UJ | RB, FD |
| 10565397 | 10565397001 | LAO-SS-1-061021 | EPA 200.8 | Lead | UJ | ICS, RB |
| 10565397 | 10565397002 | LAO-SS-1-061421 | EPA 200.8 | Aluminum | U | RB |
| 10565397 | 10565397002 | LAO-SS-1-061421 | EPA 200.8 | Lead | UJ | ICS, RB |

Note that there were 2 data points qualified for more than 1 indicator of accuracy (ICS and RB).

This resulted in 50 (8%) of the 622 natural data points associated with the natural samples collected that did not meet the accuracy requirements, and 572 (92%) of the 622 natural data points that did meet the accuracy requirements.

5.3 Representativeness

Representativeness is a qualitative parameter that is addressed through proper design of the sampling program. The sampling program defined in the QAPP was designed to determine if treated groundwater quality meets the end-of-pipe discharge standards at EFS-07 (LAO-SS-1) and the effectiveness of the BTL treatment system.

The laboratory results were reviewed, and a Stage 4 data validation completed. Based on information provided by Pace, the chain of custody requirements were met for each of the sample events. Preservation requirements were met for all samples and all samples were analyzed within the appropriate holding times except for the alkalinity analyses in SDG 10565397, and the low-level mercury analyses in 10559768. Results were qualified for the holding time exceedance and are considered usable as screening quality data. There were 16 natural data points qualified due to an exceedance of holding time (Reason Code = H) as listed below:

| | | | | | DV | DV Reason |
|----------|---------------|-----------------|-----------|---------------------------------|------|----------------------|
| SDG | Lab Sample ID | Field Sample ID | Method | Analyte | Flag | Code |
| 10565397 | 10565397002 | LAO-SS-1-061421 | SM 2320B | Alkalinity, Total as CaCO3 | J- | Н |
| 10565397 | 10565397002 | LAO-SS-1-061421 | SM 2320B | Alkalinity, Hydroxide (CaCO3) | IJ | Н |
| 10565397 | 10565397002 | LAO-SS-1-061421 | SM 2320B | Alkalinity, Bicarbonate (CaCO3) | J | H, FD |
| 10565397 | 10565397002 | LAO-SS-1-061421 | SM 2320B | Alkalinity, Carbonate (CaCO3) | IJ | H, FD |
| 10565397 | 10565397004 | LAO-SS-2-061421 | SM 2320B | Alkalinity, Total as CaCO3 | J- | Н |
| 10565397 | 10565397004 | LAO-SS-2-061421 | SM 2320B | Alkalinity, Hydroxide (CaCO3) | UJ | Н |
| 10565397 | 10565397004 | LAO-SS-2-061421 | SM 2320B | Alkalinity, Bicarbonate (CaCO3) | J- | Н |
| 10565397 | 10565397004 | LAO-SS-2-061421 | SM 2320B | Alkalinity, Carbonate (CaCO3) | UJ | Н |
| 10565397 | 10565397005 | LAO-SS-3-061421 | SM 2320B | Alkalinity, Total as CaCO3 | J- | Н |
| 10565397 | 10565397005 | LAO-SS-3-061421 | SM 2320B | Alkalinity, Hydroxide (CaCO3) | UJ | Н |
| 10565397 | 10565397005 | LAO-SS-3-061421 | SM 2320B | Alkalinity, Bicarbonate (CaCO3) | J- | Н |
| 10565397 | 10565397005 | LAO-SS-3-061421 | SM 2320B | Alkalinity, Carbonate (CaCO3) | IJ | Н |
| 10559768 | 10559768001 | LAO-SS-1-050621 | EPA 245.1 | Mercury | J- | H, <rl< td=""></rl<> |
| 10559768 | 10559768002 | LAO-SS-1-051021 | EPA 245.1 | Mercury | J- | H, <rl< td=""></rl<> |
| 10559768 | 10559768004 | LAO-SS-2-051021 | EPA 245.1 | Mercury | J- | Н |
| 10559768 | 10559768005 | LAO-SS-3-051021 | EPA 245.1 | Mercury | J- | H, <rl< td=""></rl<> |

The results were determined to be representative of the water quality present at BTL LAO during the quarter. The results can be used for evaluating compliance of the treated water with the appropriate performance standards.

5.4 Completeness

Completeness is assessed to determine if enough valid data have been collected to meet the investigation needs. Completeness is assessed by comparing the number of valid sample results to the number of sample results planned for the investigation. The completeness target for this investigation was 95% or greater as designated in the CFRSSI QAPP (ARCO, 1992b). Samples were collected twice weekly at EFS-07 (LAO-SS-1) and once weekly at INF-04 (LAO-SS-2) throughout the quarter. Samples were collected at 1 additional surface water site at MSD-HCC (LAO-SS-3) once a month. All the required samples were collected. Pace analyzed all the samples for the required analytes as listed in Table 2 of the QAPP. Additionally, there were 4 samples (LAO-SS-1-050621, LAO-SS-1-051021, LAO-SS-2-051021, and LAO-SS-3-051021) that had the standard mercury and the low-level mercury analyses performed as discussed in Section 5.6.

In total, 622 natural data points were generated by the sampling events. All the natural data points were usable as no sample results were rejected, 100% of the planned samples were collected, and 100% of the planned analyses were performed. This meets the 95% QA/QC completeness DQO listed in the CFRSSI QAPP (ARCO, 1992b).

5.5 Comparability

Comparability is assessed to determine if one set of data can be compared to another set of data. Comparisons are made by examining and comparing the laboratory and field methods used to acquire sample data for different distinct data sets. The data summarized in this report includes water samples collected by Pioneer and analyzed by Pace.

The water quality samples were collected using standard sampling methods and Pioneer SOPs. The sampling design, SOPs, and laboratory analytical methods are based on EPA and other industry standard practices and were documented in the field logbook.

Sample collection was completed by professionals who were properly trained in the SOPs and equipment use. Proper chain of custody and sample handling were observed during sample collection, delivery to the laboratory, and analysis. The analytical laboratories performed the sample analysis using industry standard methods.

Consequently, data from future surface water sampling events at BTL LAO using comparable sampling and analytical methods may be used in concert with this data set.

5.6 Sensitivity

Sensitivity is a quantitative measure and is evaluated by comparing the laboratory RL or the laboratory MDL to the project required detection limit.

To evaluate sensitivity, the required reporting limits (RRL) listed in the Montana Department of Environmental Quality (DEQ) Circular 7 (DEQ-7) (DEQ, 2019) for aluminum, arsenic, cadmium, copper, iron, lead, mercury, silver, zinc, and nitrogen (NO2 + NO3) are compared to the laboratory MDL. The remaining analytes (calcium, magnesium, uranium, hardness, total alkalinity, bicarbonate alkalinity, carbonate alkalinity, hydroxide alkalinity, TDS, TSS, and sulfate) have no RRL listed in a Montana Circular DEQ-7 and do not have Applicable or Relevant and Appropriate Requirements for this project.

The laboratory MDL met the RRL for all applicable analytes except nitrate (as NO2 + NO3). The RRL for nitrate (as NO2 + NO3) is 0.01 milligram per liter (mg/L) and the Pace MDL was 0.078 mg/L. All the natural sample results for nitrate (as NO2 + NO3) were detections above the MDL. The usability of sample results that had detectable levels of analytes is not affected by an MDL that is higher than the RRL. Additionally, the Montana Circular DEQ-7 human health standard for nitrate/nitrite is 10 mg/L; therefore, this MDL is considered low enough to meet project needs.

For the samples in SDG 10559768, Pace was unable to perform the low-level mercury analysis (MDL = 0.0047 micrograms per Liter [μ g/L]) within the required hold time (28 days). Pace was instructed to perform the standard mercury analysis (MDL = 0.045 μ g/L) within hold time and the low-level mercury analysis when possible. The low-level mercury analyses were performed with hold times of 32 and 29 days. The low-level mercury results for natural samples were all detections and were qualified "J-" for exceeding the hold time. The low-level mercury results for these samples were usable for the project and met the sensitivity requirement. The RRL for mercury (0.005 μ g/L) was not met for the standard mercury analysis; however, the MDL for the standard mercury analysis was lower than Applicable or Relevant and Appropriate Requirements (ARAR) for mercury (0.05 μ g/L) and are usable for the project. The samples, results, data validation qualifiers, and RRL and ARAR levels for mercury are summarized below:

| | N | Mercur | y (μg/ | L) | Mercu | ury, lov | v-leve | l (μg/L) | | |
|-----------------|--------|------------|--------|---|--------|------------|--------|---|--------|----------|
| | М | DL = 0. | 045 μ | g/L | MI | DL = 0. | 0047 բ | ιg/L | Mercur | y (μg/L) |
| Field Sample ID | Result | DV Flag | S/E | Reason Code | Result | DV Flag | S/E | Reason Code | RRL | ARAR |
| LAO-SS-1-050621 | <0.045 | | Е | | 0.007 | J- | S | H, <rl< td=""><td>0.005</td><td>0.05</td></rl<> | 0.005 | 0.05 |
| LAO-SS-1-051021 | <0.045 | | Е | | 0.007 | J- | S | H, <rl< td=""><td>0.005</td><td>0.05</td></rl<> | 0.005 | 0.05 |
| LAO-SS-2-051021 | 0.047 | Α | E | <rl< td=""><td>0.018</td><td>J-</td><td>S</td><td>Н</td><td>0.005</td><td>0.05</td></rl<> | 0.018 | J- | S | Н | 0.005 | 0.05 |
| LAO-SS-3-051021 | <0.045 | | Е | | 0.005 | J- | S | H, <rl< td=""><td>0.005</td><td>0.05</td></rl<> | 0.005 | 0.05 |

For analytes without an RRL, the laboratory MDLs were consistent with anticipated MDLs listed in Table 2 of the QAPP; therefore, the sensitivity is considered low enough to meet project needs.

5.7 Overall Data Summary

The list following shows an overall summary of the validation performed on the data generated by Pace for the samples collected during the quarter sampling events.

| | | otal tural | Level A/B | DV Flag J, J+, J-, or UJ | DV Flag R | DV Flag U or A | Enforcement Quality | Screening Quality | Rejected |
|---------------------------------|---------|---------------|--------------|--------------------------------|--------------|-------------------|-----------------------------|-----------------------------|-----------------------------|
| Sample Location | Samples | Data Points | A/B | Data Points | Data Points | Data Points | Data Points (% of Total) | Data Points (% of Total) | Data Points (% of Total) |
| EFS-07 (LAO-SS-1)* | 26 | 364 | В | 55 | 0 | 39 | 309 | 55 | 0 |
| INF-04 (LAO-SS-2) | 13 | 194 | В | 8 | 0 | 6 | 186 | 8 | 0 |
| MSD-HCC (LAO-SS-3) | 3 | 64 | В | 7 | 0 | 0 | 57 | 7 | 0 |
| Total for Natural Samples | 42 | 622 | В | 70 | 0 | 45 | 552 | 70 | 0 |

Flag and Reason Codes are defined in Table A5.

< - Not detected at the method detection limit.

The qualifications made to the field duplicate samples (DV Flag/Reason Code) are not included in the summary of qualifications made to natural samples discussed in the Data Validation Report.

Abbreviations:

SDG = Sample Delivery Group

DF - dilution factor

RL - reporting limit

ABS DIF - absolute difference

RPD - relative percent difference

mg/l - milligram per liter

Footnotes:

1. If the control limit is an absolute difference less than the repoting limit, the minimum reporting limit will be used if the samples have varying dilution factors.

Flag and Reason Codes are defined in Table A5.

< - Not detected at the method detection limit.

The qualifications made to the field duplicate samples (DV Flag/Reason Code) are not included in the summary of qualifications made to natural samples discussed in the Data Validation Report.

Abbreviations:

SDG = Sample Delivery Group

DF - dilution factor

RL - reporting limit

ABS DIF - absolute difference

RPD - relative percent difference

mg/l - milligram per liter

Footnotes:

1. If the control limit is an absolute difference less than the repoting limit, the minimum reporting limit will be used if the samples have varying dilution factors.

Notes:

The qualifications made to the field blank samples (DV Flag/Reason Code) are not included in the summary of qualifications made to natural samples discussed in the Data Validation Report.

Flag and Reason Codes are defined in Table A5.

< - Not detected at the method detection limit.

Abbreviations:

SDG = Sample Delivery Group mg/l - milligram per liter MDL - method detection limit

SM 2540C Total Dissolved Solids SM 2540D Total Suspended Solids SM 4500-NO3-H Nitrogen, NO2 plus NO3

ASTM D516 Sulfate

Abbreviations:

SDG = Sample Delivery Group

Table A5. Laboratory Flags; Data Validation Qualifiers; Enforcement, Screening, and Rejected Codes; and Reason Codes Definitions

Lab Flag (Pace Analytical Services [Pace])

- U = Indicates the compound was analyzed for, but not detected.
- J = Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
- B = Analyte was detected in the associated method blank.
- D6 = The precision between the sample and sample duplicate exceeded laboratory control limits.
- H1 = Analysis conducted outside the recognized method holding time.
- H5 = Reanalysis conducted in excess of EPA method holding time. Results confirm original analysis performed in hold time.
- M1 = Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- M6 = Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution. spike level.
- 1M = Analyte detected below the reporting limit, therefore result is an estimate.
- H2 = Extraction or preparation was conducted outside of the recognized method holding time.
- MD = The analyte was not detected at or above the Method Detection Limit.

DV Flag (Data Validation Qualifiers)

- U = The result is qualified as non-detect due to the detection of the analyte in an associated QC blank. sample.
- J+ = The result is an estimated quantity, but the result may be biased high.
- J- = The result is an estimated quantity, but the result may be biased low.

or imprecise.

A = results between the MDL and RL with no other qualifiers required are considered enforcement quality data.

S/E (Screening/Enforcement Quality Designation)

- E = Enforcement quality.
- S = Screening quality.
- R = Unusable (Rejected) quality.

Reason Code (Data Validation Reason Codes)

- < RL = Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
- CCV = Qualified due to Continuming Calibration Verification recovery problems.
- CL = Qualified because working range of instrument is exceeded.
- CS = Qualified due to low-level calibration check standard percent recovery outside control window.
- FD = Qualified due to field duplicate results outside of control limits.
- H = Qualified due to analysis holding time exceedance.
- ICS = Qualified due to detections in the Interference Check Sample.
- ICV = Qualified due to Initial Calibration Verification recovery problems.
- RB = Qualified due to detections in the rinsate blanks.
- S% = Qualified due to percent recovery of the matrix spike outside of control limits.
- SD = Qualified due to percent difference of serial dilution outside control limit.

| Stage 4 Data Vandation Checklist for Metals Sample Analysis |
|---|
| 7. Matrix Spike Sample Results |
| Were Laboratory Matrix Spike Samples (LMS) analyzed at the frequency of 1 per batch? Y X N |
| Were LMS results within the control window 75 to 125%? Were any data flagged because of LMS problems? Y N X N X |
| |
| Describe Any Actions Taken: None Required. |
| Comments: Sample LAO-SS-1-040121 was used to generate an LMS/LMSD sample pair for total metals. The %R for the LMS and LMSD for calcium (-337% and 262%, respectively) and magnesium (-119% and 66%, respectively) were outside control limits. Per the NFG, "Spike recovery limits do not apply when the original sample concentration is ≥ 4 times the spike added. In such an event, the data shall be reported unflagged, even if the %R does not meet acceptance criteria" (EPA, 2017). The original sample concentrations of these analytes were greater than 4 times the added spike amount; therefore, no qualifications were warranted. The remaining %R were within control limits (75-125%). A second LMS was performed on a sample not from this WO. The %R for the LMS for calcium (192%) was outside control limits. The original sample concentration of calcium was greater than 4 times the added spike amount; therefore, no qualifications were warranted. Sample LAO-SS-1-040121 was used to generate an LMS/LMSD sample pair for total mercury. The %R for the LMS and LMSD were within control limits. |
| wore within control mints. |
| |
| 8. ICP Serial Dilutions Was ICP Serial Dilutions |
| Were ICP Serial Dilutions (SD) analyzed at the frequency of 1 per batch? Were SD percent differences (%D) results within the control limits? Y X N X |
| Were any data flagged because of SD problems? Y N X |
| Describe Any Actions Taken: Sample LAO-SS-1-040121 was used to generate the SD. The %D for calcium (15.4%) is outside control limits, and the original sample concentration is greater than 50 times the MDL; therefore, sample LAO-SS-1-040121 was qualified "J". Per the NFG, "For a SD that does not meet the technical criteria, apply the action to all samples of the same matrix if the samples are considered sufficiently similar" (EPA, 2017). Sample LAO-SS-1-040521 is considered sufficiently similar; therefore, qualified "J". |
| Comments: Sample LAO-SS-1-040121 was used to generate the SD. The %Ds for aluminum (32.6%) and cadmium (15.5%) were outside control limits, but the original sample concentrations were less than 50 times the MDL; therefore, no qualifications were warranted. |
| 9. Internal Standards |
| Were internal standards added to each sample in the analytical batch? Y X N |
| Were the percent relative intensity recoveries (%RI) within the control limits of 60 to 125% Were any data flagged because of internal standard problems? Y X N X |
| Describe Any Actions Taken: None Required. |
| Comments: Internal standards used on 4/16/2021 included: Ge-72, In-115, Sc-45-IS, and Tb-159. The Calibration 0 %RI equaled 100% for all internal standards. The remaining %RI ranged from 91.6% to 110.7%. The internal standards were within the control limits (60-125%); therefore, no qualifications were warranted. |
| Internal standards used on 4/19/2021 included: Ge-72, In-115, Sc-45-IS, and Tb-159. The Calibration 0 %RI equaled 100% for all internal standards. The remaining %RI ranged from 73.3% to 113.6%. The internal standards were within the control limits (60-125%); therefore, no qualifications were warranted. |
| 10. Field Blanks |
| Were field blanks (FB) submitted as specified in the Sampling Analysis Plan (SAP)? Y X N |
| Were any data qualified because of field blank problems? Y N N/A |
| Describe Any Actions Taken: None Required. |
| Comments: There was no field blank included in this work order. Field blanks are collected monthly and are summarized in the Field Blank Samples with Results, Laboratory Flags, Data Validation Qualifiers, Data Validation Reason Codes, and QC Criteria Calculations table in the Data Validation Report. |

12. Overall Assessment

Are there analytical limitations of the data that users should be aware of?

Y X N

If so, explain:

On this WO 10556183, the following qualifications were made:

In additional to the qualifications outlined in the sections above, results which are reported between the method detection limit and the reporting limit were qualified "A" when no additional qualifications were warranted.

The table below lists the qualifications on the natural samples:

| Field ID | Analyte | Final Qualification | Reason Code |
|-----------------|----------|---------------------|------------------------|
| LAO-SS-1-041521 | Mercury | UJ | CCV |
| LAO-SS-1-041921 | Mercury | J- | CCV, <rl< td=""></rl<> |
| LAO-SS-1-041521 | Lead | U | RB |
| LAO-SS-1-041921 | Lead | U | RB |

| | sults within the control window 75 to 125%? |
| | a flagged because of LMS problems? |
| Were any dan | a nagged occause of Livis providing: |
| Describe Any | Actions Taken: None Required. |
| Comments: | Sample LAO-SS-1-042921 was used to generate an LMS/LMSD sample pair for total metals. The %R for the LMS and LMSD for calcium (204% and 545%, respectively) and magnesium (132% and 261%, respectively) were outside control limits. Per the NFG, "Spike recovery limits do not apply when the original sample concentration is ≥ 4 times the spike added. In such an event, the data shall be reported unflagged, even if the %R does not meet acceptance criteria" (EPA, 2017). The original sample concentrations of these analytes were greater than 4 times the added spike amount; therefore, no qualifications were warranted. An additional LMS sample was generated from a sample not from this WO. The %R for the LMS for magnesium (60%) was outside control limits. Because the LMS was from a different WO, no qualifications were warranted. |
| | Sample LAO-SS-1-042921 was used to generate an LMS/LMSD sample pair for total mercury. The %R for the LMS and LMSD were within control limits. An additional LMS was generated from a sample not from this WO. The %R for the LMS was within control limits. |
| 8. ICP Serial Dilution | ns |

| Were an | Were any data flagged because of holding time? Were any data flagged because of preservation problems? The mercury-low level analysis was performed 1-5 days past the holding time. All natural samples had a detect for mercury. Mercury-low level results were qualified "J-" for detect results and "UJ" for non-detect | | | | | | | | |
| | results. | | | | | | | | |
| Comments: The receiving temperature as reported by the laboratory was 4.6 °C. The samples were shipped on ice and reported as properly preserved. There was no temperature blank present, so the temperature was averaged from 4 separate temperature readings. | | | | | | | | | |
| | | | | | | | | | |

| 2. Instrument Calibration | |
|--|----------------------------|
| Was the Tune analysis information performed? | Y X N |
| Was the peak width and resolution of the masses within the required control limits? | Y X N |
| Was the percent relative standard deviation $\leq 5\%$ for all analytes in the Tune solutions? | Y X N |
| Was the instrument successfully calibrated at the correct frequency? | Y X N |
| Was the instrument calibrated with the appropriate standards and blanks? | Y X N |
| Were Initial Calibration Verification (ICV) and Continuing Calibration Verification (CCV) samples analyzed? | YXN |
| Were ICV and CCV results within the control window? | Y X N |
| Were any data flagged because of calibration problems? | Y N X |
| Describe Any Actions Taken: None Required. | |
| Comments: For the 6/1/21 total metals calibration, the lab rejected the Cal 6 standard for uranium. The calibra standards. | ation was formed with 5 |
| For the 6/2/21 total metals calibration, the lab rejected the Cal 7 standard for magnesium. The cal standards. | ibration was formed with 6 |
| | |

Work Order: 10559768 Page 1 of 6

3. Blanks

| Were Initia | l and Continuing Calibration Blanks (ICB and CCBs) analyzed? | | | | | | | |
|-------------|--|--|--|--|--|--|--|--|
| Were ICBs | and CCBs within the control window? Y X N | | | | | | | |
| Were Meth | od Blanks (MBs) analyzed at the frequency of 1 per analytical batch? Y X N | | | | | | | |
| Were MBs | within the control window of less than two times the laboratory Method Detection Limit (MDL)? Y N X | | | | | | | |
| Were any d | ata flagged because of blank problems? Y N X | | | | | | | |
| Describe A | ny Actions Taken: None Required. | | | | | | | |
| Comments: | A detection of silver in the CCBs (0.000150 mg/L, 0.000140 mg/L, 0.000130 mg/L, 0.000120 mg/L, 0.000130 mg/L) analyzed on 6/25/2021 required no qualification as the detects were less than 2 times the MDL (0.000154 mg/L), as discussed in the CFRSSI QAPP (ARCO, 1992). | | | | | | | |
| | A detection of magnesium in the CCBs (0.0044 mg/L) and 0.0043 mg/L analyzed on $6/25/2021$ required no qualification as the detects were less than 2 times the MDL (0.0078 mg/L) , as discussed in the CFRSSI QAPP. | | | | | | | |
| | A detection of magnesium in the MB (0.0081 mg/L) analyzed on 5/27/2021 was greater than 2 times the MDL (0.0078 mg/L) but required no qualifications since all associated magnesium results were greater the 5 times the blank level or non-detect. | | | | | | | |
| | | | | | | | | |

4. Interference Check Samples

Were ICP Interference Check Samples (ICS) within the control limits?

Were any data flagged because of ICS problems?

Y X N Describe Any Actions Take:

In the ICS Solution A analyzed on 5/27/21 at 10:40, there was an absolute detection of cadmium (0.073 ug/L) greater than the MDL (0.030 ug/L). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. The cadmium results for LAO-

SS-1-050621 and LAO-SS-1T-051021 were qualified "J+" due to a detection in the ICS Solution A and the results being less than 10 times the ICSA detection.

In the ICS Solution A analyzed on 5/27/21 at 10:40, there was an absolute detection of lead (0.082 ug/L) greater than the MDL (0.043 ug/L). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. The lead results for LAO-SS-1-050621 and LAO-SS-1T-051021 were qualified "J+" due to a detection in the ICS Solution A and the results being less than 10 times the ICSA detection.

In the ICS Solution A analyzed on 6/2/21 at 12:56, there was an absolute detection of cadmium (0.040 ug/L) greater than the MDL (0.030 ug/L). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. The cadmium result for LAO-SS1-051021 was qualified "J+" due to a detection in the ICS Solution A and the result being less than 10 times the ICSA detection.

In the ICS Solution A analyzed on 6/2/21 at 12:56, there was an absolute detection of lead (0.082 ug/L) greater than the MDL (0.043 ug/L). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. The lead result for LAO-SS-1-051021 was qualified "J+" due to a detection in the ICS Solution A and the result being less than 10 times the ICSA detection.

Comments:

On this work order (WO), analytes that were not present in ICS Solution A but were detected included: arsenic, cadmium, copper, lead, silver, uranium, and zinc. The percent recovery (%R) for Solution A and Solution AB were within the control limits.

In the ICS Solution A analyzed on 6/1/2021 at 10:52, there was an absolute detection of lead (0.079 ug/L) greater than the MDL (0.043 ug/L). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. No results for lead were reported on 6/1/2021; therefore, no qualifications were warranted.

In the ICS Solution A analyzed on 6/25/2021 at 09:16, there was an absolute detection of lead (0.062 ug/L) and silver (0.107 ug/L) greater than the MDL (0.043 ug/L) and 0.077 ug/L, respectively). The raw data for LAO-SS-10-051021 showed that the levels for the interferents (Ca, Mg, and Na) were not similar to the corresponding true values in the ICS Solution A; therefore, no qualifications were warranted.

The remaining %RI ranged from 85.4% to 116.4%. The internal standards were within the control limits (60-125%); therefore, no qualifications were warranted. | | | | |

10. Field Blanks Were field blanks (FB) submitted as specified in the Sampling Analysis Plan (SAP)? Were any data qualified because of field blank problems? Describe Any Actions Taken: The rinsate blank, LAO-SS-10-051021, had a detection of copper (0.0039 mg/L) greater than 2 times the MDL (0.00086 mg/L). Since the rinsate blank was collected from a designated ISCO sampler that was located at LAO-SS-1, qualifications only applied to samples taken from that location. LAO-SS-1-050621 (0.016 mg/L), LAO-SS-1-051021 (0.013 mg/L), and LAO-SS-1T-051021 (0.016 mg/L) all had copper detections less than 5 times the rinsate blank detection (0.0195 mg/L); therefore, these samples were qualified "U". Comments: The field blank, LAO-SS-4-051021, had detections of calcium (0.018 mg/L) and hardness (0.06 mg/L) that were less than 2 times the MDL (0.030 mg/L and 0.108 mg/L, respectively). No qualifications were required, as discussed in the CFRSSI QAPP (ARCO, 1992). The rinsate blank, LAO-SS-10-051021, had detections of magnesium (0.0076 mg/L) and lead (0.000064 mg/L) that were less than 2 times the MDL (0.0078 mg/L and 0.000086 mg/L, respectively). No qualifications were required, as discussed in the CFRSSI QAPP. The rinsate blank, LAO-SS-10-061421, had detections of calcium (0.083 mg/L), silver (0.00016 mg/L), and hardness (0.24 mg/L) that were greater than 2 times the MDL (0.03 mg/L, 0.000154 mg/L, and 0.108 mg/L, respectively). All LAO-SS-1 results for calcium, silver, and hardness were either greater than 5 times the blank detect or non-detect; therefore, no qualifications were warranted. Since the rinsate blank was collected from a designated ISCO sampler that was located at LAO-SS-1, qualifications only applied to samples taken from that location.

Work Order: 10559768 Page **4** of **6**

11. Field Duplicates

Comments:

| Were field duplicates submitted as specified in the SAP? | Y | X | Ν | | |
|--|---|---|---|---|--|
| Were field duplicates within the control limits? | Y | | N | X | |
| Were any data qualified because of field duplicate problems? | Y | X | N | | |
| | | | | | |

Describe Any Actions Taken:

The field duplicate pair for May 2021 was submitted on this WO: samples LAO-SS-1-051021 and LAO-SS-1T-051021. For aluminum and lead, the original and/or duplicate sample results were less than 5 times the reporting limit, and the absolute difference between the sample and duplicate was greater than the reporting limit. For copper and zinc, both the original and duplicate samples were greater than 5 times the reporting limit, and the RPD between the sample and duplicate was outside control limits (20%). LAO-SS-051021 and LAO-SS-1T-051021 were qualified "J" for aluminum, copper, lead, and zinc due to field duplicate precision. Per the NFG, "For a duplicate sample analysis that does not meet the technical criteria, apply the action to all samples of the same matrix if the samples are considered sufficiently similar" (EPA, 2017). Only LAO-SS-01-050621 was sufficiently similar to warrant a "J" qualification. LAO-SS-1-050621, LAO-SS-1-051021, and LAO-SS-1T-051021 had a previous qualification for lead of "J+" due to a detect in the ICS Solution A, so the final qualification for lead was "J". LAO-SS-1-050621, LAO-SS-1-051021, and LAO-SS-1T-051021 had a previous qualification for copper of "U" due to a detect in the rinsate blank, so the final qualification for copper was "UJ".

The field duplicate pair for May 2021 was submitted on this WO: samples LAO-SS-1-051021 and LAO-SS-1T-051021. All

other total metals and mercury results were within control limits.

12. Overall Assessment

Y X N

If so, explain:

On this WO 10559768, the following qualifications were made:

In additional to the qualifications outlined in the sections above, results which are reported between the method detection limit and the reporting limit were qualified "A" when no additional qualifications were warranted.

The table below lists the qualifications on the natural samples:

| Field ID | Analyte | Final Qualification | Reason Code |
|-----------------|------------|---------------------|-----------------------|
| LAO-SS-1-050621 | Mercury-LL | J- | HT, <rl< td=""></rl<> |
| LAO-SS-1-051021 | Mercury-LL | J- | HT, <rl< td=""></rl<> |
| LAO-SS-2-051021 | Mercury-LL | J- | HT |

Were any data flagged because of holding time?

Were any data flagged because of preservation problems?

Describe Any Actions Taken:

None Required.

Comments:

The receiving temperature as reported by the laboratory was 2.0°C. There was no temperature blank present, so the temperature was averaged from 4 separate temperature readings. Samples LAO-SS-1-060321 for total metals, LAO-SS-1-060721 for dissolved metals, and LAO-SS-2-060721 for total metals were partially frozen upon arrival. The samples were shipped on ice and reported as properly preserved.

4. Interference Check Samples

Were ICP Interference Check Samples (ICS) within the control limits? Were any data flagged because of ICS problems?

Y N X Y X N

Describe Any Actions Take:

In the ICS Solution A analyzed on 7/1/2021 at 08:51, there was an absolute detection of cadmium (0.039 ug/L) greater than the MDL (0.030 ug/L). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. The cadmium results for LAO-SS-1-061021, LAO-SS-1-061421, and LAO-SS-1T-061421 were qualified "J-" due to a negative detection in the ICS Solution A and the result being less than 10 times the ICS Solution A detect. The cadmium result for LAO-SS-10-061421 did not warrant qualification since the level of interferents in the sample is not similar to the level of interferents in the ICS Solution A. The other sample results for cadmium were greater than 10 time the ICS Solution A detect; therefore, no additional qualifications were warranted.

In the ICS Solution A analyzed on 7/1/2021 at 08:51, there was a detection of lead (0.088 ug/L) greater than the MDL (0.043 ug/L). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. The lead results for LAO-SS-1-061021, LAO-SS-1-061421, and LAO-SS-1T-061421 were qualified "J+" due to a detection in the ICS Solution A and the results being less than 10 times the ICS Solution A detect. LAO-SS-10-061421 did not warrant qualification since the level of interferents in the sample is not similar to the level of interferents in the ICS Solution A.

Comments:

On this work order (WO), analytes that were not present in ICS Solution A but were detected included: arsenic, cadmium, copper, lead, silver, uranium, and zinc. The percent recovery (%R) for Solution A and Solution AB were within the control limits.

In the ICS Solution A analyzed on 6/30/2021 at 16:27, there was an absolute detection of cadmium (0.057 ug/L) greater than the MDL (0.030 ug/L). The cadmium result for LAO-SS-4-061421 did not warrant qualification since the level of interferents in the sample is not similar to the level of interferents in the ICS Solution A. The other sample results for cadmium were reported on a different day; therefore, no additional qualifications were warranted.

In the ICS Solution A analyzed on 6/30/2021 at 16:27, there was a detection of lead (0.097 ug/L) and silver (0.102 ug/L) greater than the MDL (0.043 ug/L) and 0.077 ug/L, respectively). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. The lead and silver results reported on 6/30/2021 were either greater than 10 times the ICS Solution A detect or non-detect; therefore, no qualifications were warranted.

In the ICS Solution A analyzed on 7/1/2021 at 08:51, there was a detection of silver (0.097 ug/L) greater than the MDL (0.077 ug/L). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. All silver results reported on 7/1/2021 were reported non-detect; therefore, no qualifications were warranted.

9. Internal Standards

| Were the perc | Vere internal standards added to each sample in the analytical batch? Vere the percent relative intensity recoveries (%RI) within the control limits of 60 to 125% Vere any data flagged because of internal standard problems? Y X N X N X | | | | | |
|---------------|--|--|--|--|--|--|
| Describe Any | Actions Taken: None Required. | | | | | |
| Comments: | Internal standards used on 6/30/2021 included: Ge-72, In-115, IR-193, Sc-45-IS, and Tb-159. The Calibration 0 %RI equaled 100% for all internal standards. The remaining %RI ranged from 73.7% to 121%. The internal standards were within the control limits (60-125%); therefore, no qualifications were warranted. | | | | | |
| | Internal standards used on 7/1/2021 included: Ge-72, In-115, IR-193, Sc-45-IS, and Tb-159. The Calibration 0 %RI equaled 100% for all internal standards. The remaining %RI ranged from 98.4% to 115.8%. The internal standards were within the control limits (60-125%); therefore, no qualifications were warranted. | | | | | |

10. Field Blanks

| Were any data qualified because | of field blank problems? | Y X N |
|---------------------------------|--|-------|
| Describe Any Actions Taken: | The rinsate blank, LAO-SS-10-061421, had detections of aluminum lead (0.00022 mg/L), magnesium (0.2 mg/L), and hardness (2.9 mg/L) | |

Were field blanks (FB) submitted as specified in the Sampling Analysis Plan (SAP)?

(0.0142 mg/L, 0.03 mg/L, 0.000086 mg/L, 0.0078 mg/L, and 0.108 mg/L, respectively). Since the rinsate blank is collected from a designated ISCO sampler that is located at LAO-SS-1, qualifications only apply to samples taken from that location. Qualifications for detections less than 5 times the blank detect are listed in the table below:

| Field ID | Alumin | um | Calcium | ı | Lead | | Magnes | ium | Hardness | ; |
|----------------------|--------|------|---------|------|---------|------|--------|------|----------|------|
| | Result | Qual | Result | Qual | Result | Qual | Result | Qual | Results | Qual |
| LAO-SS-1- 061021 | ND | | 98.7 | | 0.00018 | U | 32.6 | | 381 | |
| LAO-SS-1- 061421 | 0.026 | U | 91.3 | | 0.00053 | U | 33.5 | | 366 | |
| LAO-SS- 1T-061421 | 0.028 | U | 94.4 | | 0.00059 | U | 33.7 | | 375 | |

LAO-SS-1-061021, LAO-SS-1-061421, and LAO-SS-1T-061421 had a previous qualification of "J+" for lead due to a detect in the ICS Solution A. These samples will have a final qualification of "UJ" for lead.

Comments:

The field blank, LAO-SS-4-061421, had detections of calcium (0.019 mg/L), magnesium (0.0043 mg/L), and hardness (0.066 mg/L) that were less than 2 times the MDL (0.030 mg/L, 0.0078 mg/L, and 0.108 mg/L, respectively). No qualifications were required, as discussed in the CFRSSI QAPP (ARCO, 1992).

The rinsate blank, LAO-SS-10-061421, had detections of iron (0.018 mg/L), uranium-238 (0.000043 mg/L), and zinc (0.0044 mg/L) that were less than 2 times the MDL (0.024 mg/L, 0.000056 mg/L, and 0.0046 mg/L, respectively). No qualifications were required, as discussed in the CFRSSI QAPP.

The rinsate blank, LAO-SS-10-061421, had a detection of copper (0.00091 mg/L) that was greater than 2 times the MDL (0.00086 mg/L). All sample results for copper were either greater than 5 times the blank detect or non-detect; therefore, no qualifications were warranted.

11. Field Duplicates

Were field duplicates submitted as specified in the SAP? Were field duplicates within the control limits? Were any data qualified because of field duplicate problems? Describe Any Actions Taken: None Required. The field duplicate pair for June 2021 was submitted on this WO: samples LAO-SS-1-061421 and LAO-SS-1T-061421. All Comments: results were within control limits.

Work Order: 10565397 Page 4 of 5

12. Overall Assessment

Are there analytical limitations of the data that users should be aware of?

Y X N

If so, explain:

On this WO 10565397, the following qualifications were made:

In additional to the qualifications outlined in the sections above, results which are reported between the method detection limit and the reporting limit were qualified "A" when no additional qualifications were warranted.

The table below lists the qualifications on the natural samples:

| Field ID | Analyte | Final Qualification | Reason Code |
|-----------------|----------|---------------------|-------------------|
| LAO-SS-1-061021 | Cadmium | J- | ICS |
| LAO-SS-1-061421 | Cadmium | J- | ICS |
| LAO-SS-1-061021 | Lead | UJ | ICS, RB |
| LAO-SS-1-061421 | Lead | UJ | ICS, RB |
| LAO-SS-1-061021 | Uranium | J | SD |
| LAO-SS-1-061421 | Uranium | J | SD |
| LAO-SS-1-061421 | Aluminum | U | RB |
| LAO-SS-1-061021 | Iron | A | <rl< td=""></rl<> |
| LAO-SS-1-061421 | Iron | A | <rl< td=""></rl<> |
| LAO-SS-1-061421 | Mercury | A | <rl< td=""></rl<> |

The table below lists the qualifications on the field quality control samples:

| Field ID | Analyte | Final Qualification | Reason Code |
|------------------|-----------|---------------------|-----------------------|
| LAO-SS-1T-061421 | Cadmium | J- | ICS |
| LAO-SS-1T-061421 | Lead | UJ | ICS, RB |
| LAO-SS-1T-061421 | Uranium | J | SD |
| LAO-SS-1T-061421 | Aluminum | U | RB |
| LAO-SS-4-061421 | Calcium | A | <rl< td=""></rl<> |

| 4. Interference Che | ck Samples |
|---------------------|---|
| Were ICP Int | reference Check Samples (ICS) within the control limits? Y N X |
| | a flagged because of ICS problems? |
| Describe Any | Actions Take: In the ICS Solution A analyzed on 6/25/2021 at 12:31, there was a detection of lead (0.085 ug/L) greater than the MDL (0.043 ug/L). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. The lead result for LAO-SS-1-062121 was qualified "J+" due to the lead result (0.78 ug/L) being less than 10 times the ICS Solution A detection (0.85 ug/L). The other sample results for lead were greater than 10 times the ICS Solution A detection; therefore, no additional qualifications were warranted. |
| Comments: | On this work order (WO), analytes that were not present in ICS Solution A but were detected included: arsenic, cadmium, copper, lead, silver, uranium, and zinc. The percent recovery (%R) for Solution A and Solution AB were within the control limits. |
| | In the ICS Solution A analyzed on 6/28/2021 at 10:44, there was a detection of lead (0.084 ug/L) greater than the MDL (0.043 ug/L). The raw data showed that the levels for some interferents (Ca, Mg, and Na) were higher than the corresponding true values in the ICS Solution A. No lead results were reported on 6/28/2021; therefore, no qualifications were warranted. |
| 5. Laboratory Con | trol Samples |
| | tory Control Samples (LCS) analyzed at the frequency of 1 per batch? |
| | source of the LCS? Unknown |
| Were LCS re | sults within the control window of 80 to 120%? a flagged because of LCS problems? Y X N Y N X |
| Describe Any | Actions Taken: None Required. |
| Comments: | The %R for the LCS were within the control limits. |
| | |
| 6. Duplicate Sampl | |
| | tory Duplicate Samples (LDS) analyzed at the frequency of 1 per batch? Y X N |
| | esults within the control window $\leq 20\%$ Relative Percent Difference (RPD)? Y X N |
| Were any da | ta flagged because of LDS problems? Y N X |
| Dagarika Am | y Astiona Taltani. Nana Daguinad |
| Describe All | y Actions Taken: None Required. |
| Comments: | For batch 751617, the LMS and LMS Duplicate (LMSD) samples for mercury were generated from sample LAO-SS-1-061721 and used for the LDS calculation. The data user should be aware that the RPD was within control limits. No qualifications were warranted. |
| | For batch 751524, the LMS and LMSD samples for total metals were generated from sample LAO-SS-1-061721 and used for the LDS calculations. The data user should be aware that all RPDs were within control limits. No qualifications were warranted. |
| 7. Matrix Spike Sar | |
| | tory Matrix Spike Samples (LMS) analyzed at the frequency of 1 per batch? Y X N |
| | esults within the control window 75 to 125%? Y N X ta flagged because of LMS problems? Y N X |
| Describe An | y Actions Taken: None Required. |
| Comments: | Sample LAO-SS-1-061721 was used to generate an LMS/LMSD sample pair for total metals. The %R for the LMS and LMSD for calcium (-26% and 322%, respectively) and magnesium (49% and 160%, respectively) were outside control limits. Per the NFG, "Spike recovery limits do not apply when the original sample concentration is ≥ 4 times the spike added. In such an event, the data shall be reported unflagged, even if the %R does not meet acceptance criteria" (EPA, 2017). The original sample concentrations of these analytes were greater than 4 times the added spike amount; therefore, no qualifications were warranted. The remaining %R were within control limits (75-125%). A second LMS was performed on a sample not from this WO. The %R for the LMS for calcium (474%) and magnesium (185%) was outside control limits. Because the sample was from a different WO, no qualifications were required. The remaining %R were within control limits. |
| | Sample LAO-SS-1-061721 was used to generate an LMS/LMSD sample pair for total mercury. The %R for the LMS and LMSD were within control limits. |

Were any data flagged because of holding time?

Were any data flagged because of preservation problems?

Describe Any Actions Taken: None Required.

Comments:

The receiving temperature as reported by the laboratory was 3.1 °C. The samples were shipped on ice and reported as properly preserved. The laboratory sample condition upon receipt form showed the corrected cooler receipt temperature as 2.6 °C, but the COC had a temperature of 3.2 °C recorded. An email to the laboratory confirmed that the corrected receipt temperature was 3.1 °C.

| Were any dat | a flagged because of blank problems? | Y N X |
| Describe Any Comments: | Nitrogen, NO2 plus NO3 was detected in the bracketing Continuing Calibration Blank 4/28/2021 at a level that was less than 2 times the MDL (0.104 mg/L), as discussed in Therefore, no qualifications were required. The Initial Calibration Blank (ICB), CCBs, and MB for the remaining analytes were were supported. | the CFRSSI QAPP (ARCO, 1992). |

Work Order: 10556183 Page 1 of 3

| 4. Laboratory | Control Samples |
|----------------|--|
| Were 1 | Laboratory Control Samples (LCS) analyzed at the frequency of 1 per batch? Y X N |
| | was the source of the LCS? Unknown |
| Were l | LCS results within the control window of 80 to 120%? Y X N |
| Were a | iny data flagged because of LCS problems? Y N X |
| Descri | be Any Actions Taken: None Required. |
| _ | |
| Comm | ents: All the %R for the LCS were within the control limits. |
| 5. Duplicate S | ample Results |
| | Laboratory Duplicate Samples (LDS) analyzed at the frequency of 1 per batch? Y X N |
| | LDS results within the control window \leq 20% Relative Percent Difference (RPD)? Y N X |
| Were | any data flagged because of LDS problems? |
| | |
| | be Any Actions Taken: None Required. |
| Comn | ents: For alkalinity, total as CaCO3, the LDS were created from an LCS and LCS Duplicate (LCSD) sample pair, as well as sample LAO-SS-1-041921 and one sample not from this sample event. The %RPDs were within control limits. |
| | For sulfate, the LDS were created from an LCS and LCSD sample pair, as well as sample LAO-SS-1-041921 and one sample not from this sample event. The %RPDs were within control limits. |
| | For nitrogen, NO2 plus NO3, the LDS were created from sample LAO-SS-1-041921 and three samples not from this sample event. The %RPD for one sample not from this sample event (26.1%) was outside control limits (20%). Since the sample was not from this sample event, no qualifications were warranted. |
| | For total dissolved solids, the LDS were created from sample LAO-SS-1-041921 and a sample not from this sample event. The %RPDs were within control limits. |
| | For total suspended solids, the LDS were created from sample LAO-SS-1-041921 and a sample not from this sample event. The %RPDs were within control limits. |
| 6. Matrix Spil | ke Sample Results |
| Were | Laboratory Matrix Spike Samples (LMS) analyzed at the frequency of 1 per batch? Y X N |
| | LMS results within the control window 80-120%? |
| Were | any data flagged because of LMS problems? |
| Descri | be Any Actions Taken: None Required. |
| | |
| Comm | For alkalinity, total as CaCO3, the LMS and LMS Duplicate (LMSD) were created from sample LAO-SS-1-041921 and one sample not from this sample event. |
| | For sulfate, the LMS and LMSD were created from sample LAO-SS-1-041921 and one sample not from this sample event. |
| | For NO2 plus NO3, the LMSD were created from sample LAO-SS-1-041921 and three samples not from this sample event. The %R for the LMSD for one sample not from this sample event (58%) was outside control limits (80-120%). Since the sample was not from this sample event, no qualifications were warranted. |
| | The data user should be aware that remaining LMS/LMSD %Rs were within control limits. |
| 7 F. H.D | |
| 7. Field Blank | |
| | field blanks submitted as specified in the Sampling Analysis Plan (SAP)? Any data qualified because of field blank problems? Y X N X N X |
| Descri | be Any Actions Taken: None Required. |
| Comm | rents: The field blank, sample LAO-SS-4-041921, was submitted on this WO and had no detects for total alkalinity, sulfate, NO2 plus NO3, total dissolved solids, or total suspended solids. |
| | The rinsate blank, sample LAO-SS-10-041921, was submitted on this WO and had no detects for total alkalinity, sulfate, NO2 plus NO3, total dissolved solids, or total suspended solids. |

N

X

V

Y

X

N

Describe Any Actions Taken: The field duplicate pair for April 2021 was submitted on this WO: samples LAO-SS-1-041921 and LAO-

SS-1T-041921. The alkalinity, bicarbonate primary and duplicate sample results were less than 5 times the Reporting Limit (RL). The absolute difference between the primary sample and duplicate sample was greater than the RL; therefore, the samples were qualified "J" for alkalinity, bicarbonate due to poor field precision. Per the NFG, "For a duplicate sample analysis that does not meet the technical criteria, apply the action to all samples of the same matrix if the samples are considered sufficiently similar." (EPA, 2017). The remaining samples on this WO are sufficiently different based on concentrations and sample locations

to warrant no qualification.

Comments: The rest of the results for the field duplicate pair were within control limits.

9. Overall Assessment

If so, explain:

Are there analytical limitations of the data that users should be aware of?

Y X N

In additional to the qualifications outlined in the sections above, results which are reported between the method detection limit and the reporting limit were qualified "A" when no additional qualifications were warranted.

The table below lists the qualifications on the natural samples:

On this WO 10556183, the following qualifications were made:

| Field ID | Analyte | Final Qualification | Reason Code |
|-----------------|-------------------------|---------------------|-------------------|
| LAO-SS-1-041921 | Sulfate | J- | ICV, CCV |
| LAO-SS-2-041921 | Sulfate | J- | ICV, CCV |
| LAO-SS-3-041921 | Sulfate | J- | ICV, CCV |
| LAO-SS-1-041921 | Alkalinity, bicarbonate | J | FD |
| LAO-SS-2-041921 | Total suspended solids | A | <rl< td=""></rl<> |

The table below list the qualifications on the field quality control samples:

| Field ID | Analyte | Final Qualification | Reason Code |
|------------------|-------------------------|---------------------|-----------------------|
| LAO-SS-1T-041921 | Sulfate | J- | ICV, CCV |
| LAO-SS-4-041921 | Sulfate | UJ | ICV, CCV |
| LAO-SS-10-041921 | Sulfate | UJ | ICV, CCV |

Alkalinity. Per the NFG, "For a spike sample analysis that does not meet the technical criteria, apply the action to all samples of the same matrix if the samples are considered sufficiently similar" (EPA, 2017). LAO-SS-1T-051021 was considered sufficiently similar; therefore, the sample was qualified "J-" for Total

Alkalinity.

For NO2 plus NO3, the LMS and LMSD were created from sample LAO-SS-1-051021 and a sample not from $\,$ this sample event. The %R for the LMS (69%) and the LMSD (74%) created from LAO-SS-1-051021 was outside control limits (80-120%). Sample LAO-SS-1-051021 was qualified "J-". Per the NFG, "For a spike sample analysis that does not meet the technical criteria, apply the action to all samples of the same matrix if the samples are considered sufficiently similar" (EPA, 2017). LAO-SS-1T-051021 was considered sufficiently similar; therefore, the sample was qualified "J-" for NO2 plus NO3.

Comments: For sulfate, the LMS and LMSD were created from sample LAO-SS-1-051021 and two samples not from this sample event. The

%R for the LMS (132%) created from LAO-SS-1-051021 was outside control limits (80-120%). Per the NFG, "Spike recovery limits do not apply when the original sample concentration is ≥ 4 times the spike added. In such an event, the data shall be reported unflagged, even if the %R does not meet acceptance criteria" (EPA, 2017). The original sample concentration of sulfate

was greater than 4 times the added spike amount; therefore, no qualifications were warranted.

Work Order: 10559768 Page 2 of 4

7. Field Blanks

| Describe Any | Actions Taken: None Required. |
|--------------|--|
| Comments: | The field blank, sample LAO-SS-4-051021, was submitted on this WO and had no detects for total alkalinity, sulfate, NO2 plus NO3, or total suspended solids. |
| | Total dissolved solids were detected in LAO-SS-4-051021 (6 mg/L) at a level that was less than 2 times the MDL (10 mg/L), as discussed in the CFRSSI QAPP (ARCO, 1992). Therefore, no qualifications were required. |
| | The rinsate blank, sample LAO-SS-10-051021, was submitted on this WO and had no detects for total alkalinity, sulfate, NO2 plus NO3, or total suspended solids. |
| | Total dissolved solids were detected in LAO-SS-10-051021 (11 mg/L) at a level that was greater than 2 times the MDL (10 mg/L). Qualifications only applied to the LAO-SS-1 samples since the rinsate blank was collected from a specific ISCO sampler that was located at this location. All LAO-SS-1 samples were greater than 5 times the rinsate blank (55 mg/L); therefore, no qualifications were required. |

| Were field duplicates submitted a | as specified in the Sampling Analysis Plan (SAP)? | Y X N |
|-----------------------------------|--|--|
| Were field duplicates within the | control limits? | Y N X |
| Were any data qualified because | of field duplicate problems? | Y X N |
| Describe Any Actions Taken: | The field duplicate pair for May 2021 was submitted on this 1T-051021. The alkalinity, bicarbonate duplicate and the alkiless than 5 times the Reporting Limit (RL). The absolute diff duplicate sample was greater than the RL; therefore, the samplicarbonate and alkalinity, carbonate due to poor field precise analysis that does not meet the technical criteria, apply the acsamples are considered sufficiently similar." (EPA, 2017). The sufficiently different based on concentrations and sample loc | alinity, carbonate primary sample results were between the primary sample and ples were qualified "J" for alkalinity, ion. | | Comments: | Nitrogen, NO2 plus NO3 was detected in the bracketing Initial Calibration Blank (ICB) and Continuing Calibration Blanks (CCBs) $(0.075 \text{ mg/L}, 0.058 \text{ mg/L}, 0.069 \text{ mg/L}, 0.066 \text{ mg/L}, and 0.060 \text{ mg/L})$ on $6/16/2021$ at a level that was less than 2 times the IDL (0.104 mg/L) , as discussed in the CFRSSI QAPP (ARCO, 1992). Therefore, no qualifications were required. | |
| | | Nitrogen, NO2 plus NO3 was detected in the MB (0.079 mg/L) at a level that was less than 2 times the MDL (0.156 mg/L), as discussed in the CFRSSI QAPP. Therefore, no qualifications were required. | |
| | | The ICB, CCBs, and MB for the remaining analytes were within control limits. | |
| | | | |

| What was the source of the LC Were LCS results within the co | |
| Were any data flagged because | |
| were any data magged because | of Les problems: |
| Describe Any Actions Taken: | None Required. |
| Comments: All the %R for t | he LCS were within the control limits. |
| 5. Duplicate Sample Results | |
| | mples (LDS) analyzed at the frequency of 1 per batch? |
| | ntrol window ≤ 20% Relative Percent Difference (RPD)? Y X N |
| Were any data flagged because | |
| Describe Any Actions Taken: | None Required. |
| | otal as CaCO3, the LDS were created from an LCS and LCS Duplicate (LCSD) sample pair, as well as sample 421 and one sample not from this sample event. The %RPDs were within control limits. |
| | LDS were created from two LCS and LCSD sample pairs, as well as sample LAO-SS-1-061421, LAO-SS-4- a sampled not from this sample event. The %RPDs were within control limits. |
| | O2 plus NO3, the LDS were created from sample LAO-SS-1-061421 and a sample not from this sample event. re within control limits. |
| | red solids, the LDS were created from sample LAO-SS-1-061421 and a sample not from this sample event. The ithin control limits. |
| | ded solids, the LDS were created from sample LAO-SS-1-061421 and a sample not from this sample event. The ithin control limits. |
| 6. Matrix Spike Sample Results | |
| Were Laboratory Matrix Spike | Samples (LMS) analyzed at the frequency of 1 per batch? Y X N |
| Were LMS results within the co | |
| Were any data flagged because | |
| Describe Any Actions Taken: | For sulfate, the LMS and LMSD were created from sample LAO-SS-1-061421, LAO-SS-4-061421, and two samples not from this sample event. The %R for the LMS/LMSD (142% and 126%, respectively) created from a sample not from this work order and the LMS (142%) created from LAO-SS-1-061421 were outside control limits (80-120%). No qualifications were warranted for the sample not from this work order. Sample LAO-SS-1-061421 was qualified "J+". Per the NFG, "For a spike sample analysis that does not meet the technical criteria, apply the action to all samples of the same matrix if the samples are considered sufficiently similar" (EPA, 2017). LAO-SS-1T-061421 was considered sufficiently similar; therefore, the sample was qualified "J+" for sulfate. |
| | For NO2 plus NO3, the LMS and LMSD were created from sample LAO-SS-1-061421 and a sample not from this sample event. The %R for the LMSD (72%) created from LAO-SS-1-061421 was outside control limits (80-120%). Sample LAO-SS-1-061421 was qualified "J-". Per the NFG, "For a spike sample analysis that does not meet the technical criteria, apply the action to all samples of the same matrix if the samples are considered sufficiently similar" (EPA, 2017). LAO-SS-1T-061421 was considered sufficiently similar; |

Work Order: 10565397

therefore, the sample was qualified "J-" for NO2 plus NO3.

The data user should be aware that remaining LMS/LMSD %Rs were within control limits.

For alkalinity, total as CaCO3, the LMS and LMSD were created from sample LAO-SS-1-061421 and one sample not from this

Comments:

sample event.

7. Field Blanks

| | anks submitted as specified in the Sampling Analysis Plan (SAP)? a qualified because of field blank problems? Y X N Y X N X |
|--------------|---|
| Describe Any | Actions Taken: None Required. |
| Comments: | The field blank, sample LAO-SS-4-061421, was submitted on this WO and had no detects for total alkalinity, sulfate, total dissolved solids, or total suspended solids. |
| | Nitrogen, NO2 plus NO3 was detected in LAO-SS-4-061421 (0.094 mg/L) at a level that was less than 2 times the MDL (0.156 mg/L), as discussed in the CFRSSI QAPP (ARCO, 1992). Therefore, no qualifications were required. |
| | The rinsate blank, sample LAO-SS-10-061421, was submitted on this WO and had no detects for sulfate, NO2 plus NO3, total dissolved solids, or total suspended solids. |
| | Total alkalinity was detected in LAO-SS-10-061421 (2.3 mg/L) at a level that was less than 2 times the MDL (3.6 mg/L), as discussed in the CFRSSI QAPP. Therefore, no qualifications were required. |

8. Field Duplicates

Were field duplicates submitted as specified in the Sampling Analysis Plan (SAP)? Were field duplicates within the control limits? Were any data qualified because of field duplicate problems?

The field duplicate pair for June 2021 was submitted on this WO: samples LAO-SS-1-061421 and LAO-SS-Describe Any Actions Taken:

1T-061421. The alkalinity, bicarbonate duplicate and the alkalinity, carbonate primary sample results were less than 5 times the Reporting Limit (RL). The absolute difference between the primary sample and duplicate sample was greater than the RL; therefore, the samples were qualified "J" for alkalinity, bicarbonate and alkalinity, carbonate due to poor field precision. Per the NFG, "For a duplicate sample analysis that does not meet the technical criteria, apply the action to all samples of the same matrix if the samples are considered sufficiently similar." (EPA, 2017). The remaining samples on this WO are

sufficiently different based on concentrations and sample locations to warrant no qualification.

The rest of the results for the field duplicate pair were within control limits.

Work Order: 10565397 Page 3 of 4

9. Overall Assessment

Are there analytical limitations of the data that users should be aware of?

Y X N

If so, explain: On this WO 10565397, the following qualifications were made:

In additional to the qualifications outlined in the sections above, results which are reported between the method detection limit and the reporting limit were qualified "A" when no additional qualifications were warranted.

The table below lists the qualifications on the natural samples:

| Field ID | Analyte | Final Qualification | Reason Code |
|-----------------|-------------------------|---------------------|-------------------|
| LAO-SS-1-061421 | Sulfate | J+ | S% |
| LAO-SS-1-061421 | Nitrogen, NO2+NO3 | J- | S% |
| LAO-SS-1-061421 | Alkalinity, bicarbonate | J | FD, H |
| LAO-SS-1-061421 | Alkalinity, carbonate | UJ | FD, H |
| LAO-SS-2-061421 | Total suspended solids | A | <rl< td=""></rl<> |
| LAO-SS-1-061421 | Alkalinity, hydroxide | UJ | Н |
| LAO-SS-1-061421 | Alkalinity, total | J- | Н |
| LAO-SS-2-061421 | Alkalinity, hydroxide | UJ | Н |
| LAO-SS-2-061421 | Alkalinity, total | J- | Н |
| LAO-SS-2-061421 | Alkalinity, bicarbonate | J- | Н |
| LAO-SS-2-061421 | Alkalinity, carbonate | UJ | Н |
| LAO-SS-3-061421 | Alkalinity, hydroxide | UJ | Н |
| LAO-SS-3-061421 | Alkalinity, total | J- | Н |
| LAO-SS-3-061421 | Alkalinity, bicarbonate | J- | Н |
| LAO-SS-3-061421 | Alkalinity, carbonate | UJ | Н |

The table below list the qualifications on the field quality control samples:

| Field ID | Analyte | Final Qualification | Reason Code |
|------------------|-------------------------|---------------------|-------------------------|
| LAO-SS-1T-061421 | Sulfate | J+ | S% |
| LAO-SS-1T-061421 | Nitrogen, NO2+NO3 | J- | S% |
